30372. [MS topic] The Quadrantids

Yahoo group: SkywavesDX (2014)
Date: 2014-01-01 03:42:20 UTC
From: ilkka suni
Topic: 30372 Message: 30372

Hi folks,

May you all have a very QSOus year 2014! On the
rocks or not, any which way you like.

THE QUADRANTIDS meteor shower is in progress. And
from my, from us Finnish DXers' angle of ear,
this sounds like being a favourable meteor
shower, from the very beginning. The pattern sounds a lot like last Perseids.

To my antenna, lots of bursts with duration of
2...10 sec, not just useless pings. I'm just
looking forward to whether there is going to be
some massive bursts up to 30+ seconds, especially on Jan. 2nd to 5th.

A FLUKE by the Quadrantids. The very first time I
got [HNG] MR 2 Petöfi Radio on 93.9 MHz, and straight out got the MS-ID:
http://www.fmlist.org/fm_media_show.php?id=3700131&media=sound&itu=HNG

I do have to emphasise, I hold no copyright, Just forwarding what I caught.

Have good catches!

73, ilkka
[FIN-Joutseno]

I completely forgot about this meteor shower! which is a biggie with rate of 100ZHR. Once I've tidied up the workdesk I'll get the 24ht monitoring going.

30374. Yamaha TX-930 Tuner narrow filter mod - and correcting IF Offset

Yahoo group: SkywavesDX (2014)
Date: 2014-01-01 14:48:12 UTC
From: <davebunyan@...>
Topic: 30374 Message: 30374

Yesterday thing went from euphoria to the depths of despair - but this morning everything is fine (happy Snoopy dance!).

Step one was to replace the existing filters with 2 x 150 kHz and 2 x 110 kHz. The board is really easy to work on and got all four filters out without damaging them. Soldered in the SIL sockets - plugged in the filters and worked fine except that there was a 30 to 40kHz offset on the high side. .

Did a bit of fiddling and suddenly the offset was -150kHz when I switched it back on. Undid what I had done and ended up with plus 150 kHz offset.

Went as far as replacing C167 with a trimmer to adjust the xtal freq slightly (as per k6sti web site) which had no obvious effect..

Decided to go the bed and sleep on it rather than mess things up further - then check for dry joints etc in the morning

To cut a long story short - there is a variable resistor VR17 marked IF offset. If you twiddle this from one end of the range to the other - it makes no difference UNTIL you turn the tuner off and then back on again - when the frequency jumps one way or another. This VR controls Vref to the MC7210 IC - and my guess is that it has no apparent effect when the turner is one because the frequency is phased locked. So when I'd adjusted and saw no difference I wasn't returning the pot to it's previous position.

So finally I went through a series of steps - tweak pot./turn tuner off/turn tuner on check offset and after a few steps I've now got the frequency between -0.01 and 0.00MHz

Somewhere I'm sure I read someone posting that they had a problem where the tuner starts up on the wrong frequency but when switched off and back on again it's OK. Just wonder if that would suggest a dry joint around this potentiometer. Of course I can't find the posting again.

The CSL circiut is annoying on a weak signal switching in and out with a momentary mute. Is there anyway to avoid this - other than switching to fine tune?

Sometime in the near future I will add an RDS decoder board - probably externally this time. And there is an interesting choice to test out. On the Yamaha TX-500 the LA1266 is used as the FM detector - and you take the audio output from pin 12. On the Yamaha TX-930 the LA1266 is used for the FM signal strength but has a single 180kHz ceramic filter for selectivity - so it should be possible to get a suitable output from this chip - bypassing the main IF chain. The conventional point would be to take the audio from the input to the MPX decoder chip. Has anyone had any experience with this on the TX-930/950/1000/2000.

Thanks for the reminder. I usually forget about this one. I have been having a little more success with MS since doing the i2c mod. Results are better when the RF gain is not active. The signal to noise ratio is much better. Stuart first commented on this.

Here's a short video of MS bursts I had overnight: http://www.youtube.com/watch?v=YHyAmAbBzqg Nothing reached RDS. These were the longer bursts but there were dozens of very short bursts. Thanks to Peter for suggesting I try Bandicam for recording the screen video. I then edit the video in Sony Vegas where it's possible to see the meteor bursts on the audio track. Using Vegas I was able to scan through a ten hour video in about five minutes and cut out the clips I wanted. So simple! Hopefully this info will be of use.

Good DX!

30376. RE: Aerial Connector for Yamaha TX-930

Yahoo group: SkywavesDX (2014)
Date: 2014-01-01 22:04:10 UTC
From: <davebunyan@...>
Topic: 30365 Message: 30376

The variant of the Yamaha TX-930 I have is the "General" model - with switchable 110/230V and switchable frequency steps.. On page 4 of the owner's manual is a picture of the 75/300 ohm supplied transformer for US/Canada/General model - thin centre pin but push on outer 'sleeve'. The Aus/EU/UK version indicates it is male belling lee coax as per the Sony's I own.

I haven't been able to track down what this connector is, but my 'inner coax' and outer belling lee line socket works well enough.

Happy 2014, David & all subscribers

Somewhere I'm sure I read someone posting that they had a problem where the tuner starts up on the wrong frequency but when switched off and back on again it's OK.

If this is what I think you mean, then this seems to be a common complaint. Fortunately, I have experienced this problem only occasionally. I cannot completely rule out excessive signal strength being the cause since I am using a rooftop Korner 15-el yagi with 19 decibel preamp just 12 kilometres from 100 kW capital city broadcasts and the issue only affects certain vacant frequencies. What I'm describing is as follows:

The channel is clear (apart from occasional extremely weak jet scatter) for say 15-20 minutes and then - boom - all of a sudden an image of a local station (typically 400 kHz below) appears on that clear channel, blocking any chance of DX.

Logically, the microprocessor-controlled CSL circuit may be the cause since activating the attenuator does not solve the problem nor does disabling frequency lock.

And of course, the key benefit of this tuner is its excellent overload immunity which is genuinely needed here. The front end also approaches the theoretical limits of tuner sensitivity, so I am personally uncomfortable using any attenuation!

Switching the tuner off for 30 seconds does solve the problem.

CSL can be defeated but I think from memory signals are received in mono. Disabling the muting of CSL would be beneficial but realistically it might also be impossible. When analyzing Es recording waveforms it can actually be useful. In particular, you know exactly when it switches to wide from narrow (the default auto IF mode) when the signal becomes quieting. After some years growing accustomed to this tuner, I've grown to live with the half second mute but ultimately it comes down to personal tolerance levels I guess. For me, recurrent switching back-and-forth is rarely a problem because DX signals generally never get strong enough to trigger wide mode in the first place.

So finally I went through a series of steps - tweak pot./turn tuner off/turn tuner on check offset and after a few steps I've now got the frequency between -0.01 and 0.00MHz

Would you recommend I adjust the IF offset using VR17? I'm using 2 x 150 kHz for wide in addition to 1 x 110 kHz and 1 x 80 kHz for narrow IF mode. I've honestly been to scared to mess with it because selectivity is fine, apart from a slight low side bias due to filter assymetry. In any event the ability to use 10 kHz fine tuning compensates for this to some extent.

Good DX!

Leigh

30379. Italian jingle (?) on 91.4 MHz from 12.06.2013

Yahoo group: SkywavesDX (2014)

From: Arvid Husdal
Topic: 30379 Message: 30379
Attachments: 1 described; binary payloads are missing from this source WARC

Hello;

Just for my curiousity :
I caught this "jingle"- like promo (?) on 91.4 MHz last Summer, June, 12. at T.O.H, 16.00 UTC.

However, it is still a mystery.

Anyone who knows hat station thic could be ?

73!

Hi Arvid,

I am sorry, I can't help you. But I'm sure someone can.

I could only tell what sounded to me like "Sono le 108...". You hablo italiano muy poco... On 91.4, as I gather, Radio Deejay and Radio Maria would be the most obvious ones to my location. But I'm pretty sure your station is neither of those. I would search for stations on 108.0, having realys on 91.4?

You just presented one reason why I used to kind of hate Es-openings to Italy, in the past. Too many stations on a single frequency, and in the audio clip not a hint to identity, to location.

BTW: I could use some help with unidentified clips in Arabic and Greek. Those audio clips are from way past, when I was actively monitoring Es on FM. I'd be grateful if there was someone talented in those languages, willing to help.

I apologize my blabbering and intruding your topic, Arvid. Anyway, the Quadrantids keep kicking constantly, at a low+ to moderate- rate.

Have good catches!

Moi, Ilkka;

And thank you for the nice and good suggestion !
From Suomi always good help, another suggestion is Radio Piombino.
The first "jingle" is almost like you state: "Sono 18`o clock" or something like that.
The skip was from Switzerland and Nord-Italia that day.

Italian skips can be very confusing and usually contain lots of network IDs, but
in general I would say it is good fun and it is possible to pick some local gems.

Ilkka, I think you should present your older Greek/Arab clips also to this forum, my
experience is that you will always get closer to the solution !

73 and thanks for your nice comment, good luck with those meteors :)

Hi Arvid and Ikka,

it's just a time annoucement: "Sono le 18" (It's 18 o'clock).
Surely not Radio Maria or Deejay, unfortunately nothing more to help to ID the station.

30384. Overnight meteor scatter video. Help needed please ...

Yahoo group: SkywavesDX (2014)
Date: 2014-01-03 13:48:50 UTC
From: John Faulkner, Skegness
Topic: 30384 Message: 30384

http://youtu.be/nDfIz7ej8Ss

HUNDREDS of meteor bursts caught here overnight while monitoring 93.9. Not one produced RDS, despite several signals being strong enough.

I was lucky to catch a vocal ID from Petofi Radio from Kabhegy, Hungary at 1405 km. This is 44 seconds into the recording.

The highlight is a possible Algeria, which begins 50 seconds into the recording. There are two possibilities and I suspect it may be the close of the two, Radio Constantine from Kef El Akhal at 1927 km. The other is Chaine 2 from Aflou at 2120 km, though I believe they always broadcast in French. _*Can anybody help with this one please?*_. Hopefully there is enough information to go on as this would be most distant meteor scatter to date.

The recording finishes with aircraft scatter from WDR4 from Aachen, Germany at 484 km - not bad considering I was beaming south-east throughout the entire recording!

Good DX!

John

The meteor reflections are coming through 'thick and fast' from around noon today - the number of loggings by RDSSpy is far higher than the Geminids in early Dec 2013.

It's a shame you are not getting valid RDS but I wonder whether it might be related to the bandwidth of your Sony XDR - can you manually set the b/w - your video clip suggests you can. Anything less than 120kHz b/w on my SDR set up slows down acquisition of the pi code - and on that basis I run my M-S reception in the wider bandwidth on my conventional tuners. (On strong stations - SDRSharp will give RDS down to 80kHz).

Out of interest MDR Jump is coming on on tropo scatter - which is 679km for me depite atrocious weather.

This is the best MS session I have heard here by far. As you say, this afternoon has been exceptional. Frequent (almost non-stop) bursts lasting ten or twenty seconds. Many MUCH longer than that.

It's a pity I had to go out for most of the afternoon, but I have been able to see lots of PI codes on my return, plus some PS! Like you say, I ought to experiment with wider bandwidths. I even thought about seeing if I can get hold of an old Blaupunkt Paris - the receiver I had most of my MS success with back in the 90s.

My noise levels are well down again today so that has helped enormously too. I can get full RDS at 25 dB instead of the more usual 40 dB when the noise is present.

Good DX!

Today has been just amazing, to us in Finland, too. I think this
beats last Geminids maximum, and by far beats last Perseids' max.
Almost too much sand i my ears, I have just laid back and
concentrated on collecting vocal IDs.

A few days ago, it was good to read you are getting MS better now,
John. I hope we'll have some big blasters on Saturday and Sunday.

Right now its sounds a bit like the night's visual peak is getting
closer to Finland, thus the reflections are likely to drift away from
my reach, I wouldn't know.

Rock on!

30391. FREEWARE PLANETARIUM SOFTWARE

Yahoo group: SkywavesDX (2014)
Date: 2014-01-03 20:53:39 UTC
From: <davebunyan@...>
Topic: 30391 Message: 30391

My brother drew my attention to a freeware program called "Stellarium" a few days ago. It's absolutely brilliant! You can set it up for your home location and as it opens up it will show you the 'now' night sky. You can then add constellation labels and lines and there is a DVD style control bar that allows you to run it forward/backward in time at various speeds. You can drag the display so you can reverse the NSWE convention astronomers use to the NSEW we are normally used to. Then use the data from http://www.timeanddate.com/astronomy/meteor-shower/ to find the dates and names of this year's meteor showers and you can track the position of the origin of the meteors over the 24 hr period. eg the current Quarantids originates from near the Bootes constellation which is currently below the northern horizon but will reappear around 10 pm and be highest around 7 am tomorrow - directly east.

" I think this beats last Geminids maximum"

Absolutely - I said that to the wife an hour or so ago.

I'm going to go through my audio recordings - but one I did get "live" was {almost] certsainly Radio Maria form Italy on 90.2 as part of the phrase that came through was "Ave Maria" and T.Maria is the only station with any power on that freq.

It's quieter here at the moment as the radiant is below the horizon for a while - but I expect it to pick up again after midnight.

Well this is a turn up! Probably my biggest meteor log in 15 years.

This shower was supposed to peak during the early morning of January 3rd
but, as I type, I am hearing longer bursts and more frequently than this
time 24 hours ago! Some of today's meteor scatter actually sounded like
E skip!

Good DX!

30398. XDR Bandwidth and Meteor Scatter

Yahoo group: SkywavesDX (2014)
Date: 2014-01-04 01:16:28 UTC
From: John Faulkner, Skegness
Topic: 30398 Message: 30398

Dave,

Regarding improving the RDS, I have been playing around with the IF bandwidth settings in the GTK software. As you say, "Auto" may not be the best setting. This would appear to be true. The XDR could start off too narrow for RDS due to signals being too weak. Looking at weak and stable UK signals, they do indeed appear to be 'narrowed'. This is backed up by widening the filtering on the same weak signal, which merely results in more noise.

Using UK stations I found that 142 kHz seems to be the best setting. 125 kHz is definitely slightly inferior for RDS. Less than that and forget about the RDS completely. I can't say that 142 kHz is any better than "auto" however. Perhaps it will be different on a quick-fire meteor burst. I have already had a few PI codes appear on meteor scatter since trying the 142 kHz setting so we'll see how this progresses overnight.

Cheers

John

Hi John,

Pleased you've got improved results. I use RDSSpy - which you are very familiar with - and very often a positive identification only occupies a couple of lines in the captured data stream - which is around one-fifth of a second! So a very quick lock up time is needed. RDSSpy v1.02 with its facility of having a running log is really helpful - even so I find, when I playback the data stream there are valid 'pings' where just a pi code has appeared and more interestingly I've come across a number of instances where the brief capture has missed the pi code - but captured some of the PS.

Three examples of this on 87.7 - "AC" - points to RAC1, "IO" - points to FUNRADIO and "NK" points to JEDYNKA - all very fascinating

For me the meteors stopped almost abruptly at 0300 UTC give or take a few minutes - hopefully it will improve during the day.

Good DX

David

PR1 is a common meteor scatter station so I am not too worried if it's that.

I was more interested in the Arabic station on 93.9 on my video. That has been confirmed as North African Arabic via Tarek on Real DX, but there was nothing specific in the speech to point to a particular station. The signal was easily strong enough for RDS but it never happened. I am almost 100% certain it's Radio Constantine, but I am not 100% certain that Chaine 2 broadcasts entirely in French. Not to worry - it's down to guesswork with the information at hand.

Just about to look at tonight's recording.

Cheers Paul.

John

Date: 2014-01-04 12:08:02 UTC
From: John Faulkner, Skegness
Topic: 30398 Message: 30405

I was up and about until 3am. Conditions were still good and a few live RDS bursts were still popping up. It went downhill thereafter. Still plenty of bursts, but much weaker. Nowhere near strong enough for RDS. Noise levels had increased by 0700 anyway, but there was some good scatter at that time.

As for getting the PS without the PI, I have never noticed this until recently, but I've only observed it in the XDR-GTK software. I wonder if it is possible to run RDS Spy from the GTK software? It would be interesting to see the two in operation simultaneously. There was one interesting example recently - I had E201 as the PI code and a near fully formed _NRK_P1_ on the PS. Clearly both SR P1 and NRK P1. I was beaming north-east at the time because of the severe gale winds as this direction somehow stabilises my aerial mast.

Cheers

OVER HERE, there was a peak of (very) good activity at around
0300-0330UTC. High rate and reasonably durable bursts. I was hoping
for the activity to indicate a good day ahead. Far from that...

I don't remember if he was an expert of our national meteorological
institute, on the tv news. Anyway, he mentioned this Quadrantids peak
is expected to be very sharp. And so it seems and sounds.

I wouldn't know of this Saturday afternoon, as I was watching
daymares, but the morning and this late afternoon have been very,
very quiet. Still, a huge peak it was, and it takes a good while to
listen to the Friday recordings.

TODAY'S GEM [2000+ km, 5- kW], I suppose, was the French station on
102.3, airing a commercial at 1054UTC. Unidentified, so far.

Currently, sounds like low activity over here.

The peak here was quite simply "yesterday afternoon". 1200 to 1800. Sadly I had to spend four hours of that in town. So annoying, but look what I heard with my poor MS track record! This was an amazingly good peak. I will try to compile a video of the best bits soon as this is one for keeping.

John

Yes, I noticed your catches.

I'm happy for you and David having the current MS-drive. And I'm anxious to hear David reporting on the TX-930 results, in the long run. A month or more ago, I kind of pushed him, with the TX-930 issue... :o) After all, I've owned some FM tuners and ye ole faithful TX-530 still is my favourite. Then again, never owned nor wouldn't know the capabilities of the KT-6040, AT-93, T-9090 and so on.

30410. Solar Activity

Yahoo group: SkywavesDX (2014)
Date: 2014-01-04 22:14:59 UTC
From: Janpeter van Dijk
Topic: 168 Message: 30410

Hi All,

For the first time this solar cycle, the solar flux has reached a > 200 level today. The exact solar flux at this time is a bit uncertain, as the readings seem to be flare enhanced. Indications are that we are even far above 200. The main contributor is a massive sunspot, number 11944, which rotated into view a couple of days ago and which is the largest of this solar cycle.
In any case, it is about time to take the dust off of TV sets, if still available. We may be in for some good old fashioned smeary F2 pictures of Band I analogue TV stations. For what is left of them of course.

Good DX!

Janpeter van Dijk

Hi John and Ilkka,
I still haven't finished logging my RDS reception for the 3rd, but for me the activity really kicked in after 1400UTC on the 3rd and almost abruptly stopped at around 0300UTC on the 4th.

Just for the 3rd of January I have a total of 115 identifiable loggings from the data captured with RDSSpy. That's as many as for the whole of the Geminids in early December 2013!

I've got 14 hours of recording on 87.7 from 20:37 on 3rd. I don't have the will to go through it in detail at the moment but there are loads of pings and bursts - but you can see from the general waveform of the audio file that after about 0330UTC on the 4th the activity fell away very quickly.

Ilkka will be pleased to know that the primary source of the reception was a Yamaha TX-500 - with an added TDA2330 RDS decoder chip interfacing to RDSSpy software.

I've ended up with the ability to run 4 tuners with RDSSpy but the Yammie with the aerial at the bottom of the garden has given a lot more hits.At 2131 on the 3rd it looks like one meteor provided 4 different stations on three frequencies!

Over here it looks like we will have a long wait for any decent tropo - although in the last couple of days MDR from Inselberg has come in via tropo and there was a bit of a localised lift this morning.

As for meteor scatter - it's going to be randon rocks until April - unless the Gemininds has a final fling.

Rgds

David

Chaine 2 language is Tamazight, a Berber language which sounds a bit like Arabic.
I've never heard full French programs in Chaine 2. However, French words are sometimes used in discussions, also in the Arabic language Chaine 1.
Chaine 3 is the French language network.

73,

Thank you for clarifying this G?nter. I was clearly wrong in my assumptions that Chaine 2 was French.

Tarek Zeidan says the language is North African Arabic on my recording so more than likely I suspect this is Radio Constantine. I won't log it though, even as tentative since these were exceptional meteors, perhaps intense enough for other North African possibilities.

Thanks again. Very much appreciated.

30416. RE: Yamaha TX-930 Tuner narrow filter mod - and correcting IF Offset

Yahoo group: SkywavesDX (2014)
Date: 2014-01-05 03:25:27 UTC
From: <fm104rockinstereo@...>
Topic: 30374 Message: 30416

I can tentatively confirm that disabling Computer Servo Lock (by enabling Fine Tuning mode) fixes the TX-930 problem as previously described in detail below. That is, after a while CSL locks onto the wrong frequency, typically 200 kHz or 400 kHz below the frequency appearing on the front LED display. I'm assuming CSL malfunctions in situations of extremely high signal strengths only.

The only downside with this workaround is that you have to manually choose Narrow or Wide and the lack of stereo; stereo decodes presumably rely on the CSL circuit being active. Although without a block diagram or schematic I'm simply assuming. This does not present any problem for me since the unattended digital recording system I have access to at this location only accepts a single channel anyway.

Many thanks to Dave, no doubt other 930/950 owners will find his 'hands on' experimentation invaluable.

Good DX!
Leigh

Happy 2014, David & all subscribers

Hide message history

Somewhere I'm sure I read someone posting that they had a problem where the tuner starts up on the wrong frequency but when switched off and back on again it's OK.

If this is what I think you mean, then this seems to be a common complaint. Fortunately, I have experienced this problem only occasionally. I cannot completely rule out excessive signal strength being the cause since I am using a rooftop Korner 15-el yagi with 19 decibel preamp just 12 kilometres from 100 kW capital city broadcasts and the issue only affects certain vacant frequencies. What I'm describing is as follows:

The channel is clear (apart from occasional extremely weak jet scatter) for say 15-20 minutes and then - boom - all of a sudden an image of a local station (typically 400 kHz below) appears on that clear channel, blocking any chance of DX.

Logically, the microprocessor-controlled CSL circuit may be the cause since activating the attenuator does not solve the problem nor does disabling frequency lock.

And of course, the key benefit of this tuner is its excellent overload immunity which is genuinely needed here. The front end also approaches the theoretical limits of tuner sensitivity, so I am personally uncomfortable using any attenuation!

Switching the tuner off for 30 seconds does solve the problem.

CSL can be defeated but I think from memory signals are received in mono. Disabling the muting of CSL would be beneficial but realistically it might also be impossible. When analyzing Es recording waveforms it can actually be useful. In particular, you know exactly when it switches to wide from narrow (the default auto IF mode) when the signal becomes

quieting. After some years growing accustomed to this tuner, I've grown to live with the half second mute but ultimately it comes down to personal tolerance levels I guess. For me, recurrent switching back-and-forth is rarely a problem because DX signals generally never get strong enough to trigger wide mode in the first place.

So finally I went through a series of steps - tweak pot./turn tuner off/turn tuner on check offset and after a few steps I've now got the frequency between -0.01 and 0.00MHz

Would you recommend I adjust the IF offset using VR17? I'm using 2 x 150 kHz for wide in addition to 1 x 110 kHz and 1 x 80 kHz for narrow IF mode. I've honestly been to scared to mess with it because selectivity is fine, apart from a slight low side bias due to filter assymetry. In any event the ability to use 10 kHz fine tuning compensates for this to some extent.

Good DX!

Leigh

IT'S NOT ABOUT my pleasures, David. It's about
you getting results good enough to keep you
motivated. I suppose that is one of the keywords
in every field of DXing. Without results nor ways
to improve, one easily gets frustrated and loses the spirit.

At 01:22 5.1.2014, David Bunyan wrote:

ON FM, SOME 20 years ago I came to the
conclusion, for me it is better to operate just
one receiver. I wouldn't know how many receivers
people are used to handle at one time, but I
ended DXing with 2 tuners simultaneously, after
some drastic recording errors while busy
Es-openings. Of course, I could have the other
tuner just stay put on one frequency, passively
recording and piling up the cassette tape pylon
until the cassettes collapsed all over the floor...

METEORS, THEN. I was hoping for some late
arrivals, big afterburners by the Quadrantids.
But that doesn't seem to be the case. It pretty
much appears, the Quadrantids was a coherent
concentration, although there has been some good
bursts up to even 20 seconds, this morning and noon.

One shouldn't ignore them random loose cannons,
over weeks and months to come. I'll keep my tuner
hissing and the tape rolling, just in case. Some

of my best MS audio clips of late 2013, are by
lonesome individuals out of the very dark blue.

73, ilkka

There was not much one opI had ktaneously,
after end got tires I WOULDN'T KNOW of multiple receivers recording.

30419. RE: Yamaha TX-930 Tuner narrow filter mod - and correcting IF Offset

Yahoo group: SkywavesDX (2014)
Date: 2014-01-05 11:29:24 UTC
From: <davebunyan@...>
Topic: 30374 Message: 30419

Hi Leigh,

I am not involved in electronics other than as a hobby, although I usually do a lot of research before fiddling with stuff - so I would not 'recommend' anything. I decided to 'mess' with VR17 'cos it seemed logical to get rid of any offset

What I have found out about the Yamaha TX-930 and other tuners that use the LC7210 chip is that VR17 (or it's equivalent) is specifically there to allow adjustment for off-frequency ceramic filters.

I joined the FM Tuners group on Yahoo and with a bit of digging - try searching on "CSL notes" - found the information - which confirmed one key point. You have to turn the power off and back on again to see the difference an adjustment to VR17 makes - I found that out by trial and error as its not mentioned in the service manual or application notes. And you have to do this in non-CSL mode. So I did this with the fine tuning selected.

You also have to re-align the ratio discriminator to compensate for the off-frequency ceramic filter in CSL mode. otherwise it pulls the frequency away from optimum.

Details in the postings on the FM Tuners group as the postrer has put a copyright notice on them.

As for mono/stereo - I only 'bother' with stereo to check how well quieted a signal is - any added quality to the audio is lost anyway with narrow band filters - so I'd be happy to dispense with the CSL side of things.

But don't forget thwe saying "if it ain't broke don't fix it" and if you are happy as it is - leave it alone. If you decide to adjust VR17 - make sure you know its exact position priro to adjustment so you can put it back to the original setting - and just tweak it a little bit at a time. If the offset gets worse - go back the other way. The full span is -150kHz to +150kHz - so 1degree change in potentiometer position = 1kHz change in offset

I have also found a slight difference in offset between wide (2x150KHz) and narrow (adding 2x110kHz).- but as the narrow setting sounds perfectly OK it's not a problem.

That is very impressive - isn't that an arabic station at 17:03?? If so wouldn't it be Radio Chlef from Algeria - as the others are probably too far away I know it's showing a pi code of E251 but that's a hangover from an earlier burst as the software doesn't look as though it resets the pi code after the signal drops out. Maybe the french station on 88.3 is France Inter from Carcasonne.

I must try Bandicam myself in tandem with RTL-SDR

Bandicam is superb. The trial version only lets you record a maximum of ten minutes unfortunately. It's £23 to buy without restrictions.

I have received several Arabic bursts during this meteor peak. Sadly there wasn't enough to go on on my 93.9 clip, but I have had Radio Chlef before via meteor scatter. I couldn't believe it myself until I ran their web stream and heard more bursts from them. Ain N'Sour is 1913 km from here.

I don't think I was by the radio to check for a parallel of the 88.3 French burst. Carcasonne is indeed the most likely possibility but I think other smaller transmitters are also likely. I never used to think anything less than a few kW would propagate well on band 2, until I had Radio Chablais from Port Valais, Switzerland on 87.6 at just 500 watts. With the right sized rocks I think we can expect to hear a lot more than we would ever imagine.

Very nice compilation John. It's a pity I missed most of this.

I remember getting Arabic-language and French North African bursts on 87.6 and 87.7 at our first place here. No doubt these were Algerian as well. I'm sure 93.9 would be Radio Constantine as it's the logical tx that would get through.

Good DX.

30433. RE: Rotator Question

Yahoo group: SkywavesDX (2014)
Date: 2014-01-05 22:22:09 UTC
From: <davebunyan@...>
Topic: 30429 Message: 30433

The problem is - the cheapest "quality" rotator is £345 (Yaesu G-450 from radioworld.co.uk). This compares to £55.00 for the Conrad rotator - and all the cheap ones look to be the same except for cosmetic differences.

The Conrad one comes with a 2 year warranty - it has had good reviews so I went for that one - then at least for a relatively cheap price I can see how everything works out. I can easily drop the mast if very high winds are predicted - and it means I can replace it myself so it wasn't worth jumping up to 6 x the price. If it lasts three years I will be happy. And I don't intend to put anything bigger than 5 elements Band 2 on it and no more than 30 inches of stub mast. The latter is very important as the longer the stub mast the more sideways force in the wind - and I've seen a number of photos posted where the stub mast is far too long compared to what is recommended.

If you have to get someone in to fit it/replace it - then the economics change.

Also the Conrad one is said to only be suitable for a 44 mm (1.75 inch) mast, but a review said it fitted a 2 inch pole - which I can confirm. You can fit it to a 2 inch pole with out having to force anything.

The reviews for the Channelmaster 126 are quite scathing compared to that for the one from Conrad.

Rgds

David

30441. Digital radio covered in a dissertation

Yahoo group: SkywavesDX (2014)
Date: 2014-01-07 14:17:55 UTC
From: Günter Lorenz
Topic: 30441 Message: 30441

Andrea Lawendel from Italy runs a nice blog where I recently came across this:
https://www.ideals.illinois.edu/bitstream/handle/2142/26240/Anderson_John.pdf?sequence=1
A dissertation with an interesting critical view on the digitalization of radio, mainly from the US (HD) perspective. The guy is going to be a Doctor of Philosophy in Communications, so don't expect too much technical stuff. Although I prefer (and I think most of the Skywaves members do) the technical and propagation physics aspects of the hobby, the document offers many other interesting levels of "radio".

Here's the link to the full blog article (in Italian):
http://radiolawendel.blogspot.de/2014/01/il-dilemma-irrisolto-della-radiofonia.html?utm_source=feedburner&utm_medium=feed&utm_campaign=Feed:+Radiopassioni+%28Radiopassioni%29

I didn't mean there would be nothing - and this afternoon I had three nice bursts including 13 seconds+ from France Culture on 87.7 and yesterday I heard a few seconds of Arabic on 93.0 at 13:52 UTC - most likely from Tunisia.These on the TX-900 with added TDA2330 RDS decoder.

Apart from that the troposphere is completely churned up by the weather systems but has provided some interesting and surprising scatter signals that peak up for a few minutes before disappearing. I've had German stations from Rimberg (611 km) and Inselberg (679 km) come up to reasonable strength, as well as closer ones from Teutoberger-Wald and Grosser Feldberg. The TX-930 seems to have the edge over the Sony 920 for intelligibility..Polarisation is being scrambled too with Flemish and Dutch stations coming in equally well on the both horizontal and vertical but not at exactly the same instant.

Lots of good bursts here too Dave.

I have put an FM3 in the garden for meteor scatter. It's about a metre above the ground and I am hearing lots of bursts and pings all over the place, so far up to 26 dB. That's pretty good going for such a small aerial. It's ultra quiet being well away from the property, plus it's not receiving much ground wave at this height. Surprisingly, this too is picking up distant German transmitters. A good signal-to-noise ratio makes all the difference.

Good DX!

Hi guys, folks

I suppose you know how handy camera tripods are,
for low altitude antenna mounting and tilting, at
least for short experimental periods. For winds
and long term installation, take for example some
old, basic Velbon from the eBay for £5...10
pounds. Them old tripods are of sturdy make, and
they easily carry the extra weight if needed to
keep the tripod standing in wind. This is just my observations.

I like the random rocks, and this ongoing
aftermath of the Quadrantids. As I gather, it is
basic astrophysics and laws of gravity, the
random rocks occasionally are good bursters. Over
here in Finland, we also had a nice activity peak
yesterday at around 2000 to 2000UTC, but I just did not feel like loging.

As the temperatures around here are at last to
turn winterish, I'm looking forward to some
random frosty rocks. Rocks on the rocks, that would be.

Hi John and Ilkka,

Good to hear, John, that you are getting good results on a low mounted garden aerial. I was motivated to try this originally because of your comments about a past experience using a low loop antenna. As I had a spare aerial and a spare 12 foor pole I initially just tested this and was sufficiently pleased to go the whole hog and do a permanent job with a rotator as well. I've got a low noise MOSFET preamp with about 14dB gain to overcome cable loss and the four way splitter - and end up with a small net gain at the tuners.

Ilkka, I plan to take my old camera tripod and antiference aerial with me when I go on holiday and I've posted a picture of another easy to use temporary aerial mount - an upside down rotary clothes line with a 4ft/1200mm short mast added. Done to test out a Moxon aerial. Picture it apears under "DaveB" in the photos section.

Thank you very much Arvid. This is a meteor 'first' here. Technically, some of tonight's bursts were strong enough to produce RDS, but I guess distortions of the signal may have stopped this.

I just uploaded a video to show the meteor scatter on my FM3 overnight. Quite amazing to say it is only one metre above the ground. I might replace this with an FM5.

Thanks and best wishes!

Ok, now I'm gonna rip my pants. Once again.

I have these two words in Spanish, on 102.3 at 0628UTC this morning.
But I did not have the time (or the will?) for immediate live stream
matching, listened to the recording only just now.

Grreat...

30464. Sweet Spots & Dead Zones

Yahoo group: SkywavesDX (2014)
Date: 2014-01-08 20:43:31 UTC
From: John Faulkner, Skegness
Topic: 30464 Message: 30464

I have been reluctant to post this as I don't want to suggest that a Triax FM3 can outperform a K?rner 9.2. Very obviously it cannot. The latter is a vastly superior antenna, yet I find myself in an unusual and rather unfortunate situation where the newly sited FM3 is dragging in more continental DX than the rooftop 9.2. This is the result of 'sweet spots'. The FM3 is obviously in a very sugary sweet spot on the garden, the positioning of which is quite critical. I have to assume that the 9.2 is in a dead zone - quite a noisy one too, up there on the roof. When I was trying out the 9.2 on the garden I remember being very impressed at how good it was. Then it went up on the roof and I knew this was probably going to be a noisy location for it. I had no other option due to antenna restrictions with the local housing association. But I had no idea that this end of the rooftop would be a dead zone, which it now seems to be.

I won't drag this out here so I will point you in the direction of the blog entry I have just written about this which gives more detail.
http://skegnessdx.blogspot.co.uk/2014/01/sweet-spots-dead-zones.html

Again, I hope this will be of interest/use.

Here's a quick video too, showing Q Music on 100.7, recorded on the horizontal FM3 while I was out this afternoon. The vertical 9.2 doesn't get it like this at this time of year, let alone in horizontal.

Switching on tonight I was greeted with a rasping buzzing noise across the band, worse at the bottom end. It's making normally fully quieting mono signals noisy and semi locals noisier in stereo. I really hope this isn't a new permanent pest.

Whether there is any connection with a couple of occasions last month when the aerial appeared to lose directivity and a couple of semi-locals disappeared I don't know, but I hope to find out on Friday as I am having someone over to look at the aerial and cabling. I have been worried that the coax cable is suffering from water ingress after being up for over 7 and a half years and the recent very wet & windy weather. Fingers crossed this fixes it.

Good DX.

Nick, Whitchurch, Hampshire.

Yamaha T-2, Denon TU-800L, Kenwood KT-1100SD (modified), Yamaha T-85, Sony XDR-F1HD tuners, Triax FM5 horizontal beaming east.

Hi John,

I am not sure if I understand correctly your describing the syndrome, but are you referring to ground conductivity? I don't know what this expression "sweet spot" means, is it about ground conductivity and geomagnetic fields?

Anyway, sounds as interesting and mysterious as is my horizontal 8 element VKN hoovering in a certain 20...30 degree zone better than any other direction.

Have you tried DXing when mobile? You're listening to a weak signal as you pull into a car park on the top of the hill. Ooops, you just lost the signal. Reverse the car a bit - there, it's back again. You then drive your car forwards and backwards to find that 'sweet spot' where the signal was best. There can be a big difference.

This happens when mobile. It must surely happen with static antennas on rooftops, but do we ever try the antenna at different points along the entire rooftop?

I have no idea about ground conductivity though I am sure that plays apart.

There are also other considerations which can affect things, the SWR (which we rarely check on a domestic receiving antenna), the length of the coax, interaction with the ground, etc. as you suggest.

The successes with meteor scatter may also be due to the FM3 having a wider beamwidth and therefore being able to potentially grab more signals.

I am just so surprised by the apparent equality of the gain of the FM3 and the 9.2. I stress, this has to be because of the apparent sweet spots and dead zones, not a comparison of the overall performance of each antenna.

DXING WHEN mobile. I understand you are referring to a built-in car radio and its whip (nowadays window) antenna? With their ground and the car body as a reflector, I guess a yagi works in a different way. I would not know.

But I do remember various occasions in the 80's, a thunder storm struck right in the middle of a prominent Es opening. Usually, it was July 2nd to 3rd week, at around 1000 to 1300UTC, and the opening was towards Germany or the U.K. I took the Satellite 600 and the car, headed for the nearby downhill skiing centre to get 150 metres above sea level. In the "Faraday cage", DXed both with the car radio and the Grundig with its telescope stuck out of the window. I found no difference as for Es, the way the car was positioned. Later on I settled for listening at home, let the lightning strike or not as I had noticed, the Es opening died out within say 10 minutes of the thunder rising right above: no use rushing to the top of the skiing centre.

And I do recall well, my DXing expediton of 1993 to the northernmost Finland, Lapland. Back then, with my companion I was for North America, Japan and the Hawaians on MW. I had these mobile phones, the 450MHz was integrated in the car, when as the 900MHz was handheld. The closest mast for both networks was some 40 kilometres away. It was amusing to compare, which wavelength had field in which position.

I WOULD NOT know of anything else I have experienced. As for the coax the only thing I know is, the shorter feed the better and copper lead beats aluminium, including shielding.

As for the positioning, last summer I spent 2 months trying to get the FM5 I bought in July, work. I placed the antenna in various positions and heights, and the only thing I noticed making a difference was the agl, the higher the better. But that was with tropo reception.

For MS, I am going to try this low based antenna you and David have.

A good point. I presume the Yagi will respond in the same way as the car whip, with peaks and troughs. I would love to hear from other members' experiences with this. Has anybody moved a Yagi on a mast, just a few metres, and observed a difference in signals when moving it around? Surely it must be the same. I will try a few more experiments tomorrow, but my experience last night has probably shown this to be true for Yagis.

When transmitting, the precise length of coax can play a part in the overall matching/SWR of the antenna, depending on whether it has been cut closer to a voltage node or a current node - at least, that's what I understand. I cannot possibly be certain of the technicalities so maybe somebody could chip in. The same would be true for receiving, though may not be so apparent.

Yes, it could be interesting. These simple experiments can often throw up some interesting quirks.

By the way, I just had a nice 30dB burst from Kossuth Radio on 103.0 shortly before typing this! This is on the FM3 again.

Good DX!

SORRY, I FORGOT to ask about your roof surface
material. If it is steel, things of course get
tricky as the antenna gets fooled to believe the
roof for ground. Also, if there is the roof
ladder or fire escape of steel too close to the
antenna, problems may occur. But I believe we all know these basics.

As I was renewing the roof of my shack, 15 years
ago, I stuck to bitumic surface material, just to
avoid the headache on FM-DX. And now that we have
this painful terrestrial digi-TV I've noticed the
problems people have, with their houses having
steel roof. Almost like 50's comedy, folks
swinging their tv antennas back and forth. I'm
not expecting at all to see what it'll be like, with digital FM radio.

As for analogue FM I am happy, over here people
are free to erect which ever kind joystick they
want for an antenna, at least so far. But one
never knows, as the housing regulation keeps getting tighter and tighter.

Hi folks,

Sounds, the window has been open for big leaps in last 45 minutes or
so, just like it was yesterday.
I was expecting the rocks to drift more westernly. Instead, the
reflections appeared heading S/SW.

The Geminids did not offer this kind of potential for 2.000+ km QSOs.
This Quadrantids behaves a bit similarly as the Orionids in last October.

Hello Ilkka.

I have covered some of the points below on numerous occasions and I hope this isn't getting on people's nerves. Of course I hope this information helps others, but there is plenty more detail on my blog.

The roof here is covered with red brick tile. It is a fairly large three bedroom semi-detached bungalow. This has the typical wooden beams internally, quite densely packed. There are a few short metal strips which hold these together in places, but no larger metal plating of any kind. Sorry but I do not know the terminology for roofing materials so I hope 'beams' and 'metal strips' will do.

The roof is also quite tall and steep sided and you can stand upright throughout most of the loft space. There is more in the way of metal on the loft floor due to the materials we have stored inside, metal chairs, etc., but I have deliberately kept these at the opposite end of the loft to the 9.2 location.

My problems are two-fold. The 9.2 receives noise and I have now discovered it is in a dead zone. I cannot do anything about the noise. I have had OFCOM out FOUR times to investigate but they will do nothing, despite spending hours with me each time and taking a genuine interest. They stopped short of taking their equipment around the neighbourhood to find the noise sources. In any case, my local stations are perfectly audible, so they don't have to do anything.

I have been reading some very interesting information about what happens to an antenna when it is in close proximity to other objects such as buildings. The detrimental effects are quite obvious. It struck me that none of us are in an ideal location, unless we are either very lucky, or have the money to invest in huge tower systems. We all assume that by mounting the antenna at the highest point on the roof that we have done the best thing. The reality is sadly often different and I wanted to make this point.

It seems to be very much worth the extra time experimenting with the positioning of the antenna before you mount it permanently. Naturally I will be looking into moving the 9.2 to another location on the roof, assuming there are sweet spots, which I assume there will be, but I know there may be consequences from the housing authorities. Still, I have permission for two antennas now. I cannot erect them more than one metre above the rooftop, though I got away with the 9.2 being 2 metres above due to the elements needing the clearance when vertical, so that was a bonus.

Nothing is ever perfect.

John

Looking at http://dl1dbc.net/Meteorscatter/ the azimuth is just right at the moment for all the Christmas time shower leftovers (click "antenna" at the bottom left - radio pings arrive at a different angle than the visuals do). This is a great tool to know exactly when to be alert.

The "main beam" of Quadrantids was very narrow and all according to this radar. I was following 98.6 as it shifted from hundreds of hits to Jemne Melodie to continuous bits of Antenne BB within two hours. (I had both webstreams on)

MS 03.01.14 0919 98.60 SVK Jemné Melódie Košice/Dubník KE 80 kW 1271 km 192 deg
MS 03.01.14 0932 98.60 D Antenne Brandenburg Cottbus Calau brb 100 kW 1158 km 221 deg

Of course, on top of these, there are a lot of random reflections that don't fit to the pattern.

Happy pings,

Jukka

Hi again John,

IT QUITE DOESN'T sound as if there would be anything home-based metallic, distracting the reception. Strange things these are, sometimes.

ABOUT THE URBAN noise, you are right on spot. And there is very little us DXers can do about it, unless a noise source interferes local broadcasts.

Just a week or so ago I realised, why on earth am I loging an s1...2 tropo signal level, as in winter time the background noise is so high I couldn't even tell anything weaker than s2. All the households around, with all the heating/AC and lumination. In the summer time, this location luckily is quiet enough to tell even an "s1.5" signal level. Then again, there's this single xxxx xxxxxx creating massive noice. The very xxxxxxxx totally kills my MW and HF.

When DXing I do all I can, to minimize the noise by my own quarters. For instance, I still have these already banned wolfram bulbs for lighting. For external transformes, I use them old-school bulkies. The only noise would be the DSL modems. Luckily, mine are not of the noisiest, and with a long RJ-45 cable things settle.

I GUESS ONE should do experimenting for days before mounting an antenna permanently. Of course, that doesn't happen too often.

Last summer, when fiddling with the FM5 positioning, I found this telescopic garden tool to be an excellent temporary antenna mast. It is a 3-piece aluminium telescope, some 18 ft. long fully extended. The stick was sturdy enough to carry the FM5 even without being externally supported. It was very handy to try different positions and heights with the stick. Such a telescope would be an ideal antenna mast when car traveling, as the telescope fits in just 6 ft. A simple pipe clamp and some string will do for external supports. Eventually, the stick and the FM5 went down on Nov. 17th, as being not proprely supported she couldn't handle the 100 ft/sec. wind...

John:

Glad you have brought up this topic for discussions.

The most likely reason why you have a dead-zone with your
rooftop antenna is due to internal (your home) proximity electrical

and/or electronic appliance interference. Other external sources

would be the AC power lines, A/C-Heater, cable and satellite dish antennas coexist a short distance away from the APS-13.

On top of your complex interference, factor in your neighbors residing just metres away from you.

Hi Ilkka,

just catching up on the posts on this subject. When you try the lower height antenna it will be interesting to see if you get more 'hits' from closer stations than you do with the main antenna. I'm getting most reception in the 800-1200 km range - only FunRadio at 1495 km appears regularly beyond that distance and it's rare to get beyond that. You current loggings appear to be mainly in the 1000-1800km with 2000km+ logging at time.

This is a very good subject when I built a replica of the Antiference FM 3 using 1/2" tubing I refer this as a homebrew aerial I didn't think it would be as good as I found it to be.
I mounted it 2 ft above gutter height strategically placed to reduce the signal levels of the BBC/local powerhouses thus allowing more frequencies to be useful for DX this has worked much above my expectations.

At my location I am bombarded by many TX's giving 75 db+ and the band is chocker block here's an example I can receive Holme Moss/Llangollen with no aerial in the tuner.
Now here is a twist during the last tropo events I noticed when receiving SWR 4 105.6/Luxy 100.7 and Santis I noticed that the signals received by Antiference FM 3 2 meters higher than the homebrew were noiser than the homebrew I put this down to signal overload desensitising the tuner.
I started to get a bit paranoid thinking is there something wrong with the Anti FM 3 so took it down and checked it and it was fine so I then put another coax in but the results were the same.

I tried raising the the Anti FM 3 and It was the same but then I noticed something else were the aerial was I could receive BBC R Leicester 104.9 which in flat conditions would just give a PI after raising the aerial by a foot it's in the back of the box.
Here is another example of sweetspots when I erected 2 vertical dipoles side by side seperated by about 2 ft one cut for 88 Mhz and the other 98 Mhz I found that on 100.7 one of them would receive Heart from Sutton and the other would receive Real from Bilsdale.
I have one vertical dipole up at the moment and that is on the chimney and That receives Classic from Arfon on 100.7.

My location is 126 M asl that's the reason for the chocker band here fortunately I have had little problems with noise (touch wood).

Here are pictures of my aerials.

Hi Dave.

Nice to hear from you. Before I called OFCOM about my noise levels I made a thorough investigation of everything in the property. I knew the main sources of interference - the CCTV PSU, which was moved to another room, and very slight noise from my router's PSU. Eventually, I disconnected the entire mains to the property right at the control box, even isolating the burglar alarm, which usually stays on constantly. The house was totally isolated and I ran the XDR from a leisure battery. I was able to use headphones into the output, which just about provides enough audio to hear, albeit very quietly. The noise levels did not change. I had long believed the neighbouring property to be the source of most of the noise, but they were away for two whole days recently. I experienced the same noise, which switched itself on and off, at different times each day, probably ruling out a thermostat or timer device.

The usual sources of interference over here are PLT devices, power-saving light bulbs (which I have personally never had a problem with), plasma TVs and noisy thermostats. Cheap switch-mode PSUs are also a big problem here.

So I am no further with this, but there it is again, for the record.

Thanks.

John

This is really interesting Andy. Moving an aerial by such a small distance can really make that much difference. Strange but true!

The practice is often very different to the theory.

Thanks for sharing.

From: <davebunyan@...>
Topic: 30464 Message: 30486

Tropo reception was/is slightly up today so I went for a walk to a slightly elevated spot a couple of hundred metres from my house and away from houses - probably adding another 5m m agl. The Tecsun gave some nice results from Egem on 98.6 and from Goes on 87.9. So I tried moving around a bit and sure enough strong or weak reception if I moved by a couple of metres. So radio in pocket with fully extended whip aerial vertical I walked home listening on 98.6 and the reception came and went (and I don't think is was fading as such).

And also the same experience as Andy - on the elevated ground more adjacent channel interference than lower down. Noise level on the Tecsun was 0 db and clear reception when the station was only showing 2dB.

One thing it does show - if you can't put up a super aerial you may still get good results - and a 3 ele in a low noise zone will be more effective than a higher gain one in a noisy area.

30488. Headphones recommendations?

Yahoo group: SkywavesDX (2014)
Date: 2014-01-10 04:03:52 UTC
From: ilkka suni
Topic: 30488 Message: 30488

Hi folks,

THERE IS a curse on me, no doubt about that.

Just as I had written this
<<<<<And I do recall well, my DXing expediton of 1993 >>>>>
in another topic yesterday, the headphones I had
bought just for the very expedition, came to an end.
Maybe just too many steppings on the connection
cable, and the lead was cut right next to the
phone. But alright, 20 years is a good life span
for headphones in DX use, with tens of thousands times put on and taken off.

CAN YOU FOLKS, please, recommend an affordable
yet good quality headset for DXing. Say in the
price range eur. 100...150 / £80...120. I
wouldn't know if one can get a good headset for such a price.

Also, I wouldn't know of them true hifi earphones
suiting DXing. It is about the same as is FM
monitoring on hifi loudspeakers. Does not sound
good, as hifi loudspeakers are designed for
reproducing music, not to enhance speech tones and cut FM noise.

THIS VERY headset I liked so much was of the 90's
midprice models by Beyerdynamic. Suited very well
for both FM and AM/SSB audio . Then again I have
a couple of midprice hifi headsets of late 80's
by Sennheiser, and they don't suit my FM DXing at
all: especially the hissing noise sounds far too
sharp, making FM DXing almost painful for the
ear. Now alright I know, I should connect a
graphic equalizer to my tuner, instead of having
them lying around in the closets.

ONE THING I have noticed is, them low price
headphones sold in megastores are not too good
for DXing. I have a few of these cheap headsets
by Philips and some other brands, and they are
pretty useless. A regular joke is this Canman
HP-660, came to me along with a bunch of cables
and other stuff, in an auction deal. That headset
truly is of tincan sound and horrible low...mid range boost.

Thanks in advance, for the possible recommendations.

Hi David,

At 17:18 9.1.2014, David Bunyan wrote:
> You current loggings appear to be mainly in the 1000-1800km with
> 2000km+ logging at time.

MY CURRENT MS logings are a bit misleading, as due to my local
30kW-tx I am having the antenna almost all the time pointing at
200...220 degrees, i.e. towards Italy...Spain. So being, I do not get
too many of them Swedes to my west/northwest, within the
600...1.000km range. To my east, there are not many potential
Russians on the CCIR-FM, in the MS range.

In the S/SW, closer than 1.000km, there are for example transmitters
in northern Poland, but I haven't been on their frequencies lately.
These RMF FM and Radio Zet for instance, are powerful and vertical,
so to my horizontal they give very short and overloading bursts,
difficult to read.

Just noticed, there is this very affordable model by Beyerdynamic,
BT-235. Has anybody tried that very model for DXing, how does the audio suit?

At just eur.40 I strongly doubt the quality. Then again, along the
decades I am used to hifi models by AKG, Beyerdynamic and Koss (with
reservations, Sennheiser) being quality products.

I got France - Fr Musique on 87.7 at 1707UTC on 07/11/13 - listed as 100 watts. With PI Code:F203 and most of the PS:MUSIQU-- (Taurids shower)

I have to say I was gob-smacked.

I also received a single phrase in "BBC" English on 87.7 at 0740 on 14/12/13 and the only station that fits is BFBS Radio from Maastricht in the Netherlands - also 100 wats - which is very short hop at 347km - as it was in the middloe of the Geminids shower and typical of the short snatches of M-S reception..... (Geminids shower).

For SpE I have a 40 watt statiob from Romania on 89.5 logged PI Code EA0C. And fro 50 watt stations I have R,Candil 87,6, Onda Valencia 87.8 - both received twice and Radio Moldova on 100.5 - all with full PI Code and enough of the station name to make id certain.

More overnight MS, but with a German ID at 19 seconds. This was on 92.1 and it sounds like BB Radio to me, but I don't see one listed. Maybe an overnight service. If so, who would be carrying this?

The recording starts off with Radio Wien on 89.9 with PI AC0C, which I assumed was erroneous at first until I saw the partial PI and AFs.

Not sure who the French is on 92.1, presume Inter from Perpignan, and there is also something Slavic towards the end.

There are also a few bursts from BBC Radio 2 on 89.9 which has to be Wenvoe or Black Hill - very short MS at 309 and 409 km if so.

Thanks

John

Hi Andy,

It'snot actually too difficult to clone a reasonable antenna - biggest problem I had with making my own antenna was ensuring that, with a circular boom, I got all the mounting holes drilled so the elements were all properly in line.

I've done a bit of modelling of your twin dipole arrangement and as I thought, the two aerials are interacting one aerial (88MHz) ends up being fairly directive in one direction at 100-102 MHz and the other is somewhat directive the other way. Which could explain why on 100.7 you got one station on one aerial and one on the other. I couldn't model the effect of having a coax feed to both dipoles - only one at a time. (Used 4NEC2 program).

A single vertical dipole with a shorter parasitic array - as per the Antiference set up will give a much improved bandwidth 62 inch for dipole, 54 inch for parasitic element spaced 2.5 inches in front of the dipole gives an SWR of 2:1 at 86, rising to 2.0 at around 102 and getting to 4:1 at 110MHz. Must not be too close to the mast to avoid distortion of the radiation pattern.

Hi Ilkka,

just catching up on the posts on this subject. When you try the lower height antenna it will be interesting to see if you get more 'hits' from closer stations than you do with the main antenna. I'm getting most reception in the 800-1200 km range - only FunRadio at 1495 km appears regularly beyond that distance and it's rare to get beyond that. You current loggings appear to be mainly in the 1000-1800km with 2000km+ logging at time.

HRT booming in here 87.7 along with VAL 202 87.8.

Tried to post an alert but for some reason Yahoo won't let me.

http://youtu.be/qoFJPMSJxhA

More overnight MS, but with a German ID at 19 seconds. This was on 92.1 and it sounds like BB Radio to me, but I don't see one listed. Maybe an overnight service. If so, who would be carrying this?

The recording starts off with Radio Wien on 89.9 with PI AC0C, which I assumed was erroneous at first until I saw the partial PI and AFs.

Not sure who the French is on 92.1, presume Inter from Perpignan, and there is also something Slavic towards the end.

There are also a few bursts from BBC Radio 2 on 89.9 which has to be Wenvoe or Black Hill - very short MS at 309 and 409 km if so.

Thanks

John

Hi ilkley,
I have tried a few brands over the years, for budget you would be hard pressed to beat the Sony Mdrxr600 l paid about £30 for them good extention, and smooth treble, also good comfort.
My personal favourite are audio technica es7, superb sound quality, however they cost £135ish. I ppurchased 2 used pairs via eBay for around £60, they are that good. Crisp treble, clear mid range, really low bass, to the point l discovered low end noises that where not audible on other headphones, the good news, the sound is still well balanced. I also have some audio technica athe55,great mid and high frequency, a bit lean on the bass.
Hope this helps

I bought a pair of Sennheiser HD439 headphones last summer to replace a very old Sony pair that were on their way out. They certainly sound good to me with a nice balanced and open sound. They cost around £70 so possibly the sort of thing you are looking for.

Good DX.

Nick, Whitchurch, Hampshire.

Yamaha T-2, Denon TU-800L, Kenwood KT-1100SD (modified), Yamaha T-85, Sony XDR-F1HD tuners, Triax FM5 horizontal beaming east.

From: <davebunyan@...>
Topic: 30507 Message: 30507

Despite the poor and turbulent weather over recent days I've a fair amount of tropo scatter turning up with German stations out at 550 km or more. I can lie in wait on 87.9 and get MDR Figaro from Inselberg for a minute or two now and then (679km)

This morning on 87.6 horizontal I had hr3 from Sackpfeif, Nostalgie (BEL) and Radio 10 from the Netherlands following one another over a 10 minute period. Arounnd 16:30 WDR from Langenberg on 101.3 was giving a pi code, and Pure FM from Wavre is giving full RDS.

Hi Damien,

Thanks for the tips and a good description. Yes,
Audio Technica is a good brand, I had forgotten about it.

I'd rather spend the £135 on hedphones than buy
several cheap headsets, having them go in the
closets as they don't suit DXing let alone listening to music.

Hi Nick,

Thanks for the tip, I'll keep the model in mind.

I wouldn't know if it is possible today, just about anywhere, to test modestly priced headphones with one's own audio clips. Of course that would be possible when talking about the ultimate hifi and headsets costng hundreds, when visiting a store specialised in hifi audio. But in these megastores, I doubt.

In my Ears the Jingle sounds like Hit Radio, but many Stations use this
as part of their ID.... I can't remember if NDR 2 use it. I know Antenne
Niedersachsen and Antenne MV use it, but these are not on 92.1 MHz.

Thanks David for that info on the dipole I will try what you have suggested when I next go up on the roof.

As for drilling the holes on the boom I am pleased with myself that I managed to get them accurate as it is difficult on a round boom.
I will post a photo of the dipole/parasitic assembly that I made which is adjustable.

Andy

On Friday, 10 January 2014, 14:40, "davebunyan@..." <davebunyan@...> wrote:

Hi Andy,

It'snot actually too difficult to clone a reasonable antenna - biggest problem I had with making my own antenna was ensuring that, with a circular boom, I got all the mounting holes drilled so the elements were all properly in line.

I've done a bit of modelling of your twin dipole arrangement and as I thought, the two aerials are interacting one aerial (88MHz) ends up being fairly directive in one direction at 100-102 MHz and the other is somewhat directive the other way. Which could explain why on 100.7 you got one station on one aerial and one on the other. I couldn't model the effect of having a coax feed to both dipoles - only one at a time. (Used 4NEC2 program).

A single vertical dipole with a shorter parasitic array - as per the Antiference set up will give a much improved bandwidth 62 inch for dipole, 54 inch for parasitic element spaced 2.5 inches in front of the dipole gives an SWR of 2:1 at 86, rising to 2.0 at around 102 and getting to 4:1 at 110MHz. Must not be too close to the mast to avoid distortion of the radiation pattern.

David

---In skywavesdx@..., <radioredcat@...> wrote:

This is a very good subject when I built a replica of the Antiference FM 3 using 1/2" tubing I refer this as a homebrew aerial I didn't think it would be as good as I found it to be.
I mounted it 2 ft above gutter height strategically placed to reduce the signal levels of the BBC/local powerhouses thus allowing more frequencies to be useful for DX this has worked much above my expectations.

At my
location I am bombarded by many TX's giving 75 db+ and the band is chocker block here's an example I can receive Holme Moss/Llangollen with no aerial in the tuner.
Now here is a twist during the last tropo events I noticed when receiving SWR 4 105.6/Luxy 100.7 and Santis I noticed that the signals received by Antiference FM 3 2 meters higher than the homebrew were noiser than

the homebrew I put this down to signal overload desensitising the tuner.
I started to get a bit paranoid thinking is there something wrong with the Anti FM 3 so took it down and checked it and it was fine so I then put another coax in but the results were the same.

I tried raising the the Anti FM 3 and It was the same but then I noticed something else were the aerial was I could receive BBC R Leicester 104.9 which in flat conditions would just give a PI after raising the aerial by a foot it's in the back of the box.
Here is another example of sweetspots when I erected 2 vertical dipoles side by side seperated by about 2 ft one cut for 88 Mhz and the other 98 Mhz I found that on 100.7 one of them would receive Heart from Sutton and the other would receive Real from Bilsdale.
I have one vertical dipole up at the moment and that is on the chimney and That receives Classic from
Arfon on 100.7.

My location is 126 M asl that's the
reason for the chocker band here fortunately I have had little problems with noise (touch wood).

Here are pictures of my aerials.

Antiference FM 3.

http://i593.photobucket.com/albums/tt15/radioredcat/My%20Aerials/100_1490_zps8dca4156.jpg

Homebrew.

http://i593.photobucket.com/albums/tt15/radioredcat/My%20Aerials/100_1494_zps264cd736.jpg

Vertical dipoles this is where the homebrew aerial is now.

http://i593.photobucket.com/albums/tt15/radioredcat/My%20Aerials/100_1092.jpg

From: John Faulkner, Skegness
Topic: 30497 Message: 30516

Thanks Paul.

I thought it sounded Polish at first but clearly something Slavic.
Croatian sounds correct to me, quite a distinctive language.

I might monitor 92.1 again to see if it comes up with a PI code.

Best DX!

John

Hi folks,

Did I ever tell you I'm a certified idiot? Plus I
am half deaf? I guess i din't even need to.

I kept just staring at this 00:19 where the
jingle was supposed to be, not llstening to the
lot. It's not a commercial, it is a promo, and at
00:26 the guy mentions Bayern 1. Still, I can't
make the jingle. Es ist zu lange seit Ich habe
Deutsch gesprachen oder zu deutschsprachige UKW-Sendungen gehören.

Now, maybe it is going to get better or get
deafer... I bet the latter mentioned.

It's OK Ilkka.

I have many failings too, not least my endless ability to rush things
and confuse two separate issues, people, etc. I think it's old(er) age
creeping on in my case. As DXers we have a lot of information to take in.

Three modes of propagation today!

The Es opening was tricky since signals were mostly too low for RDS.
There weren't a lot of stations, however the MUF reached at least 97.5.
It might have been much higher, but I was chasing what seemed to be
enhanced meteor scatter for several minutes before I reallised these
were in fact Es.

Only the FM3 was able to get RDS and noise free signals. The 9.2 was subject to 20dB of noise until the late evening and I could barely hear the Es.

Good DX!

From: ilkka suni
Topic: 30372 Message: 30520

Hi Dave,

THE CONDITONS were quite peculiar on Friday the 10th, at around 0900-1000UTC.

To orientate and find out about the current
conditions, I was on 92.4MHz where the usual MS-suspects are
[D] RBB Kulturradio, SWR1 RP and SWR1 BW, and
where [S] SR P1 [60kW, 599km] is the most common tropo visitor.

AT 0901 UTC, SWR1 Rheinland-Pfalz bursted in
good, for some 3...5 seconds. I was surprised to
notice, the burst left RBB Kulturradio on weakly,
just like a weak tropo signal, and RBB stayed on
for several seconds. Usually, those two stations
don't come in on the same rock and if they do,
the stations both burst in one after another,
with a good signal level. Not like RBB did, this time.

I hanged on 92.4MHz for 20...30 minutes, not a
single burst. What, why, how come? Why does RBB
keep silent, what ever happened to SWR1 Baden-Württemberg? Where are the rocks?

MOVED ON to 92.2 which is a very good frequency
for me to figure out the current MS map. I had
them 6...8 potential stations, live streams
running. In came SWR3 B-WÜ, and just as I had
loged it, in came another German burst. That was
a surprising one, far from the obvious ones. I
was quickly catching up with the live streams,
identified the programme, and *bong*, yet another
German speaking station, none of the usual ones.
Took me too long to check out the live streams.
By the format and tx location I concluded it was
Deutschlandradio Kultur with 100 watts [1377 km]. Still, just tentative.

SORRY ABOUT the long story. But my previous power record on MS is 200 watts.

Considering the recent massive solar burst, I bet
there was some kind of mixed conditions involved,
as it is quite uncommon I would catch a station
with less power than 1...2 kW, on MS.

Hi all,
well its amazing how quickly ebay sellers do they right thing when you
rant at them and threaten them with bad feedback

I can't comment on the FM performance of the PL-380 until condx improve
but i can say that as far as AM is concerned they've fixed that
horrible choppy AGC action that made the 606 & 310 unlistenable IMO

also the automute is either absent or so reduced as to be invisible in practise

Here is a picture of the dipole assembly of the Antiference FM 3 replica.

http://i593.photobucket.com/albums/tt15/radioredcat/100_1443_zps61f538db.jpg

I cut a couple of inches of a 1" boom to accommodate the element mounting plates and studding from the dipole box with nuts to provide adjustment.

Andy

On Friday, 10 January 2014, 22:32, Andrew Webster <radioredcat@...> wrote:

Thanks David for that info on the dipole I will try what you have suggested when I next go up on the roof.

As for drilling the holes on the boom I am pleased with myself that I managed to get them accurate as it is difficult on a round boom.
I will post a photo of the dipole/parasitic assembly that I made which is adjustable.

Andy

On Friday, 10 January 2014, 14:40, "davebunyan@..." <davebunyan@...> wrote:

Hi Andy,

It'snot actually too difficult to clone a reasonable antenna - biggest problem I had with making my own antenna was ensuring that, with a circular boom, I got all the mounting holes drilled so the elements were all properly in line.

I've done a bit of modelling of your twin dipole arrangement and as I thought, the two aerials are interacting one aerial (88MHz) ends up being fairly directive in one direction at 100-102 MHz and the other is somewhat directive the other way. Which could explain why on 100.7 you got one station on one aerial and one on the other. I couldn't model the effect of having a coax feed to both dipoles - only one at a time. (Used 4NEC2 program).

A single vertical dipole with a shorter parasitic array - as per the Antiference set up will give a much improved bandwidth 62 inch for dipole, 54 inch for parasitic element spaced 2.5 inches in front of the dipole gives an SWR of 2:1 at 86, rising to 2.0 at around 102 and getting to 4:1 at 110MHz. Must not be too close to the mast to avoid distortion of the radiation pattern.

David

---In skywavesdx@..., <radioredcat@...> wrote:

This is a very good subject when I built a replica of the Antiference FM 3 using 1/2" tubing I refer this as a homebrew aerial I didn't think it would be as good as I found it to be.

I mounted it 2 ft above gutter height strategically placed to reduce the signal levels of the BBC/local powerhouses thus allowing more frequencies to be useful for DX this has worked much above my expectations.

At my
location I am bombarded by many TX's giving 75 db+ and the band is chocker block here's an example I can receive Holme Moss/Llangollen with no aerial in the tuner.
Now here is a twist during the last tropo events I noticed when receiving SWR 4 105.6/Luxy 100.7 and Santis I noticed that the signals received by Antiference FM 3 2 meters higher than the homebrew were noiser than
the homebrew I put this down to signal overload desensitising the tuner.
I started to get a bit paranoid thinking is there something wrong with the Anti FM 3 so took it down and checked it and it was fine so I then put another coax in but the results were the same.

I tried raising the the Anti FM 3 and It was the same but then I noticed something else were the aerial was I could receive BBC R Leicester 104.9 which in flat conditions would just give a PI after raising the aerial by a foot it's in the back of the box.
Here is another example of sweetspots when I erected 2 vertical dipoles side by side seperated by about 2 ft one cut for 88 Mhz and the other 98 Mhz I found that on 100.7 one of them would receive Heart from Sutton and the other would receive Real from Bilsdale.
I have one vertical dipole up at the moment and that is on the chimney and That receives Classic from
Arfon on 100.7.

My location is 126 M asl that's the
reason for the chocker band here fortunately I have had little problems with noise (touch wood).

Here are pictures of my aerials.

Antiference FM 3.

Andy

On Thursday, 9 January 2014, 15:18, "davebunyan@..." <davebunyan@...> wrote:

Hi Ilkka,

just catching up on the posts on this subject. When you try the lower height antenna it will be interesting to see if you get more 'hits' from closer stations than you do with the main antenna. I'm getting most reception in the 800-1200 km range - only FunRadio at 1495 km appears regularly beyond that distance and it's rare to get beyond that. You current loggings appear to be mainly in the 1000-1800km with 2000km+ logging at time.

Hi all.

In the last few days I have been suffering with intermittent wideband QRM/hash on Band 2. I say intermittent but it is usually on for hours at a time although early mornings and sometimes late evenings are free of it. Today hasn't been as bad - it was quiet from lunch time until 5 pm so I have just done a recording of it on a blank channel (87.7) and uploaded it to Box:

https://app.box.com/s/wzy0qapjbxvfbko2tqbb

I wonder if it is a new TV that the neighbours have got that has an unshielded switched-mode PSU? It is enough to light up 1 bar on the signal strength meter on the Denon tuner and wipe out the weakest DX signals.

I do hope this isn't going to be ongoing for months. It is a real pain!

Good DX.

Nick, Whitchurch, Hampshire.

If it is the telly and you get on well with them, buy them a braid breaker filter and see if it stops the interference being radiated by the aerial coax.

Hello Tim,

Based on extensive reading and watching several youtube videos, the verdict is that the PL-380 is good on MW as you describe, but let down by having a smaller ferrite rod. The new version of the PL-310, called PL310ET has a similar MW performance to the PL-380 with regard to soft mute and AGC, and much better LW (as does the original PL-310) The PL-380 is a bit down on FM compared with the PL-310 and PL-606.The direct entry buttons on the PL-310ET are better than the PL-380. I must admit I don't like the audio of the new PL-310ET though. :)

30528. Linux and Radio Software

Yahoo group: SkywavesDX (2014)
Date: 2014-01-13 14:53:42 UTC
From: John Faulkner, Skegness
Topic: 30528 Message: 30528

I am becoming increasingly frustrated with Microsoft and the time limitations on the Windows operating system. Why should I keep paying for software with unreasonably restrictive time limitations? Windows 7 hasn't been much fun either. Forget about compatibility modes and Windows Virtual Machine as it is unable to register certain drivers, such as my sound card.

A friend suggested I try Linux and one of its countless interfaces. He recommended Debian and Ubuntu as a good place to start. My immediate concern was that I wouldn't be able to run my radio software under Linux, but he pointed out that the XDR-GTK software was actually developed for Linux. Then he proceeded to show me how Perseus SDR software could be run under Linux - and could also be modified and re-programmed via the open source coding. Suddenly I found myself in a rather bewildering and exciting new world where I need to re-think about computing and start all over again

It's all new to me, but I see a world of potential here. After having a play, I see that Linux, Ubuntu, etc. seem to offer an enormous improvement over Windows. It still runs the software I need. It runs it more efficiently. Allows much greater user control and offers a lot of other advantages. Best of all, it's FREE!

I know there are Linux users here and wondered about recommendations, pros and cons, etc. It would be nice to ditch Windows, but would I be doing the right thing?

Thanks.

John

Thanks guys. I will have to ask the neighbours if they got a new plasma TV for Christmas. I do hope this isn't going to be a nightmare...

Good DX.

Nick, Whitchurch, Hampshire.

Yamaha T-2, Denon TU-800L, Kenwood KT-1100SD (modified), Yamaha T-85, Sony XDR-F1HD tuners, Triax FM5 horizontal beaming east.

My heart sank when my neighbour had an LG plasma delivered last summer but I have not had any problems with it yet.

I am surprised that the Panasonic radiates interference I would expect a cheapo one to.

New plasma screens don't make noise (usually), the screens fade as they age
and as a result they incrementally increase the drive power and this
increases the noise levels. The TV's all pass emissions tests new, but
don't after X number of hours usage.

I strongly recommend you pay a visit to http://interference.org.uk/forum/

Hi John,
I have been using Linux for many years now and I am very satisfied. I share the positive facts like you described. Actually I am using the Debian and Mint Distribution. Before I used Ubuntu. I have commited myself to Debian-based distributions.
As DX software I am actually only using RDS Spy. It works fine within the WINE emulator. I don't have a XDR tuner or Perseus. Of course it is good to know that Perseus SDR and XDR Software are running well under Linux.

Hi John

It is interesting to know that Perseus seems to work under Linux. I am using Linux for a long time (for about 15 years now) for almost all things, but I had to use Windows almost only for DX purposes also (on another laptop), because Perseus and other DX software did not run under Linux.

I must admit that I tried it (to run Perseus under Linux) for the last time about three or four years ago. Even Andrea Montefusco tried to help me, but I remember it was a very, very complicated thing and I did not succeed at last.

Maybe you could describe how you did succeed? I 100% would not be the only one to whom that would be very interesting.

At the moment, I use (at home) mostly Linux Mint and also (at school = work) a swiss educational distribution (also based on Debian) named "Lernstick" which runs from an USB stick.

Hi John,

I’m not too sure why you think they are unreasonably restrictive time limitations. Windows XP has been supported for over ten years so far, and Windows 7 will also be supported for more than ten years. I’d be surprised if the hardware doesn’t start failing before the operating system becomes obsolete. If it does last ten years then you’re looking at a cost of around £15 a most per year, which seems pretty reasonable to me.

I think Windows and Linux OSes are both very good. Linux OSes do have the advantage that a lot of the software is open source, and you can get a whole lot of really good software for free. On the other hand Windows is a lot more user friendly, and things tend to work the first time without having to spend a lot of time configuring and trying to work out what is causing problems. I’m not aware of any performance differences between the two in general, but I’ve found Windows tends to boot up and be ready for use a lot quicker than Linux OSes.

I used to have a dual boot between Fedora and Windows, but over the years virtualization has improved to the point where it’s much more convenient for me to run Fedora in a VM on Windows. It has the advantage that I can easily copy files between the two and share the clipboard.

Regards,

Martin

I am becoming increasingly frustrated with Microsoft and the time
limitations on the Windows operating system. Why should I keep paying
for software with unreasonably restrictive time limitations? Windows 7
hasn't been much fun either. Forget about compatibility modes and
Windows Virtual Machine as it is unable to register certain drivers,
such as my sound card.

A friend suggested I try Linux and one of its countless interfaces. He
recommended Debian and Ubuntu as a good place to start. My immediate
concern was that I wouldn't be able to run my radio software under
Linux, but he pointed out that the XDR-GTK software was actually
developed for Linux. Then he proceeded to show me how Perseus SDR
software could be run under Linux - and could also be modified and
re-programmed via the open source coding. Suddenly I found myself in a
rather bewildering and exciting new world where I need to re-think about
computing and start all over again

It's all new to me, but I see a world of potential here. After having a
play, I see that Linux, Ubuntu, etc. seem to offer an enormous

improvement over Windows. It still runs the software I need. It runs it more efficiently. Allows much greater user control and offers a lot of other advantages. Best of all, it's FREE!

I know there are Linux users here and wondered about recommendations, pros and cons, etc. It would be nice to ditch Windows, but would I be doing the right thing?

Thanks.

John

30536. Re: [SkywavesDX] Linux and Radio Software

Thank you Joerg, Udo and Martin.

My knowledge of Linux is next to zero, but I have been introduced to this through a friend who is a specialist in this field and I am learning.

Although I have not personally tried any radio software under Linux, my friend researched the compatibility of various items, including Perseus, and we saw various web pages which stated that these should all work perfectly well under Linux. These were the instructions regarding Perseus: http://www.montefusco.com/perseus The only one I was uncertain about was RDS Spy, but you have clarified this Joerg.

Martin. XP was my favourite Windows. 7 is fine, though it has a fair number of irritating quirks. When I bought 7 Pro 64, I had no idea that a lot of my recently purchased software would not work under Windows 7. Not only was I reluctantly forced to move to Windows 7, I was annoyed because software I had purchased - yes, software which I had *bought*, was suddenly unusable. You wouldn't buy such products in almost any other walk of life if you knew they were going to expire at some unknown point in the future, be it in six months or ten years. I know the world of computing is different and I am no longer in a position to afford expensive software. Averaging out the cost is irrelevant. It costs money, fact, as do all the other unnecessary expenses you find yourself unexpectedly lumbered with.

It's not about freeloading either, but about finding an alternative. I just need to know if it will still be possible to run my radio-related software. So I am learning. I may even still run Windows from a separate boot, I don't know at this stage. I expect any move will be a gradual one. Each operating system may have its own advantages. Time will tell.

My friend opened my eyes to the possibilities of Linux after installing it on an old laptop. I accept this is going to be a new stage of learning, but that aspect was not apparent when I had a play with the system. To all intents and purposes it looked and performed like Windows, but with a different wallpaper. Suddenly I could use my older, lesser laptops again and put them to good use.

It's more of a personal preference Martin and I don't dispute anything you say, but there are some aspects of Windows which leave me saying "Sorry, but this is not good enough anymore". Security in Windows is another issue. Viruses are another, and what I have learnt so far suggest that there are a lot of very good reasons to run Linux. From the start I saw that Linux was an operating system without the Windows 'bloat' and control. There were numerous versions of it. Linux even found, downloaded and installed all my drivers, sound card, video, etc.

without prompts.

Thanks folks.

John

After uploading a video to YouTube showing yesterday's s meteor scatter, I have received a lot of correspondence and analysis from Philip, W4WDX, an Austrian DXer who now resides in the USA, for which I am very grateful. It's probably reasonable to make assumptions to certain signals which arrive via meteor scatter, though certainly not all. I would have missed these were it not for Philip. I have never logged anything where I haven't heard the ID or seen the RDS, but it can occasionally be quite obvious which station or transmitter you are receiving, judging by the language alone. This was a particularly good haul. If only my own language recognition was better.

But beware: Care is definitely needed. After the recent spate of excellent meteor scatter it is clear that even low power FM broadcast signals can propagate quite successfully under the right meteor conditions.

After a few days investigating a DX catch I received via meteor scatter on January 9th, I am pleased to report that this catch appears to be 100% correct.

I was unable to hear the ID on the clip to begin with, despite other DXers telling me there was a very clear ID in one of my recent video recordings. It turned out that I was listening to the wrong thing, paying attention to the German OM, completely overlooking the YL jingle drop-in.

Band 2 Meteor Scatter:
103.0 0715 09-01-14 AUT Hitradio ?3, Eben (40 watts) or Ybbsitz (30 watts) Part of ?3 jingle ID heard. Weak **

It's a pity that the actual site cannot be confirmed, though Eben might be the most likely of the two possibilities due to its high elevation and take-off in this direction.

Full account with recordings here:
http://skegnessdx.blogspot.co.uk/2014/01/rare-low-power-meteor-scatter-dx.html

What this proves is that very low power FM broadcast signals are able to propagate via meteor scatter. I think many of us assume that it is only the high power stations which are able to propagate via MS.

Best of all, this reception was achieved on my Triax FM3, one metre above the ground. You don't need height for a MS antenna, assuming you have a clear horizon, and the FM3 is in a beautifully quiet location on the garden. I am getting noise free stereo signals between 15 and 20dB on the FM3, but as much as 29dB of noise on the rooftop 9.2 lately, blocking out even semi-local signals. All this proves how important it is to have good signal to noise ratio.

Good DX!

John

Excellent catch John DX has a sneaky way of surprising us at times.

Strategic placing of aerials is the way to go as you have found.

Amazing - once primed with what to listen for "uh driy" is very clear although weak in the M-S recording.

100 watts is enough for RDS - I had Fr Musique on 87.7 with PS:MUSIQU- on14/12/2013

Another really distinctive female 'jingle' is "Eins Live" which identified a 300w station via tropo for me sometime back.

So no thoughts of adding a bit more elevation - say to 3m agl? I'm going to avoid the temptation of moving my 'bottom of the garden' aerial from where it is - at 6m agl it's not too bad for tropo as I have a good take off from SE to NW.

And this whole train of postings about low elevation aerials was triggered off by your comment a couple of months back that you got much better M-S reception of a loop aerial leaning against a wall indoors where you used to live (if I remember it corectly) - which prompted me to check it out ready for the December Geminids

Wonderful how forums on the www bring things together.

More good DX

David

Thanks. I am tempted to say that there is really nothing special happening here - this reception was made with my humble FM3! Doesn't it just show the possibilities though?

I have had one or two 500 watt transmitters via meteor scatter, even with RDS. If you look at the ratio of 500 watts against 40 watts, that's less than 12dB difference (fractionally under 3 S-points), it becomes easy to see how 40 watts can still manage to push through. Most important of all - catching something like this does require one other thing, the most technical aspect of all ... Luck! I was in the right place at the right time. The signal leapt out of nowhere to revealing part of an "O3" jingle, which was very easy to miss for my ears, especially as that ID was very slightly cropped at either end. It was an easy one to miss. The timing was absolutely critical.

The real stars are those who informed me what they heard. I owe thanks, primarily to pe1etr (sorry for doubting you), Philip W4WDX who really nailed it. Also thanks to Gunter, Jurgen and Andy Webster for listening.

Good DX!

From: <fm104rockinstereo@...>
Topic: 30374 Message: 30545

Thanks David for the information, excellent work. It's summer here with Es and tropo being the priority during my free time. For this reason, I will defer the decision on whether I will adjust the IF offset on the TX-930 for the moment.

Last week just purchased a TX-950 (for more than I paid originally for the TX-930 at a bargain price). They rarely appear on Ebay Australia so I took the opportunity to pounce on this as a backup for my TX-930 which has frankly seen better days!

The good news (well in my humble opinion!) is that CSL can be switched off on the TX-950 and stereo decoding is still possible.

Other than that, it seems to be identical to the TX-930 (although I'm merely guessing, as I have not even lifted the lid off). When I get an opportunity, I will perform some desperately needed filter mods to the new beast.

Good DX!

From: <davebunyan@...>
Topic: 30374 Message: 30555

Hi,

I've got the service manual for the TX-950 - from electrotanya.com and I was sent the circuit diagram for the TX-930 by Don on the fmtuner group. I've compared the circuit diagrams which seem to be identical - parts numbering matches.

I'm going to upload my project notes to the files section when I've finished writing them up - including switchable CSL mod and adding an RDS decoder board to drive RDSSpy via a soundcard. The latter is built on a small prototype board.

Very briefly -

CSL mod - feed 5v to pin 17 on the LC7210 IC (IC4) via a 270k resistor to disable the CSL - but putting a switch in line. The 5 volts comes from pin 26 of the same IC. Connections soldered direct to the IC pins.Switch is fitted to base of the tuner.

RDS - take the MPX feed for the RDS decoder board from pin 6 on IC5, take the ground from pin 5 of IC5 and take the 5 volts from the live side of the switch installed to disable the CSL. Connections soldered to the jumpers conveniently present next to these pins. Then the clock and data outputs are fed to a 3.5 mm stereo jack socket fixed in the base of the tuner via a voltage dividers to reduce the output voltage to around 500 mV.

Rgds

David

Sittingbourne, UK

In fact, I almost certainly have those components already. I will also be sure to download the service manual for the TX-950. I notice that Hi Fi Engine also provide this, although free registration is required.

Cheers

Leigh

Nick, yeah that is exactly what the interference sounds like at one of my receiving locations... on multiple vacant frequencies. But Es will blast through it (even 100 watt stations) and it is not always evident. Slightly off-tuning with the Yamaha TX-930 using the 10 kHz steps helps. Good luck with the issue, I do sympathize.

Good DX!

Hi Leigh,

It might have been HFE that I got the SM from - I remember having to register to get one of the many manuals I've downloaded.

When drilling into the tuner base be very careful not to get any metal swarf where you don't want it. I used a hand drill so I could drill very slowly and then the swarf didn't go flying everywhere.

I've just posted a photo in the Photos section in the Dave_B album showing the mods - should be of help when it appears.

30561. QUARANTIDS JANUARY 2014 - RECEPTION LOG

Yahoo group: SkywavesDX (2014)
Date: 2014-01-17 13:04:45 UTC
From: <davebunyan@...>
Topic: 30561 Message: 30561

I have got round to entering in the last of my MS reception for 4th January - and I have attached a summary of the amazing reception which was concentrated on the 3rd/4th but the log covers the 1st to the 16th.

All but a couple of entries were from pi code or program name - and by trawling through the recorded RDSSpy datastream a number of burst were identified from a partial PS eg DY on 87.7 is jeDYnka. A tiny minority were from audio - live or recorded. There were loads of short audio bursts on the 14 hours of recording I made but I did not have the will to go through them all - but after John Faulkner's reception of O3 tucked away in another burst - I will have to go though them in small chunks - and who knows?

Note: data was downloaded from fmlist and then converted to tabular form in Excel

Thanks Leigh. Interesting. Did you try and find out what was causing it? Also, could you rotate the aerial to try and null it out?

The noise here isn't just on certain frequencies, it's right across the band on vacant channels but seems worse at the bottom end. I'm planning to change my set-up which I'm hoping will help reduce the effects.

Good DX.

An update: last night after having a nice quiet band up until 7 pm the noise started up again so I went outside with a portable to investigate. I tuned it to an empty channel at the bottom of MW and started to walk around. After a couple of minutes trying different directions and turning the radio I soon discovered that the noise was emanating from a property about 200 yards away to the NE. It's two houses together but it seemed to peak outside one of them. The same tone was coming through on MW as I was getting at home.

This morning I noticed that the FM band was QRM-free so I walked to the same spot with the portable once more and noise-levels were MUCH quieter with no sign of last night's racket. So this would seem pretty conclusive to me.

As a result I have now filled in the Radio & Television Service Diagnostic Form describing the problem and explaining how I'd located the source of the QRM. I've mentioned that it affects reception of BBC nationals (which is true as the hiss in stereo is more noticeable) and that I also intend to become a licensed ham (also true as it's something I would like to investigate in the near future).

So we'll see what happens in the next few weeks.

Good DX.

** Personal Skegness 'First'

After repositioning the garden FM5 this afternoon I noticed an even quieter FM band. The noise level is so quiet now that there is no difference in background noise whether the antenna is plugged in at the back of the XDR or if it is disconnected. An empty frequency produces a constant 4dB, though it looks less on the scale. The fact that signals as low as 10dB can be noise free just shows how quiet it is. The noise is reduced to a constant very smooth sounding mush, rather than that variable splattery hiss you often hear. Full RDS often forms with signals as low as 18dB. BBC nationals always require a few dB more.

This is quite a turn up after me moaning about the noise coming in on the 9.2, which is now up to 28dB on many frequencies at the bottom of the band, masking signals which would normally provide full RDS. It tapers off to about 10-14 dB once you get above 104 MHz, but still manages to produce increased hiss on what would otherwise be decent stereo signals.

Hi Andy.

I have the FM5 horizontal at all times and usually always beaming around 90 - 120 degrees. I have tried vertical but nothing comes in well when I do. Don't ask me why but the horizontal FM5 also allows better reception of vertical continental transmitters.

When I rotate the 9.2 from horizontal to vertical, I always take note of the effect this has on a signal. 45 degrees always results in a weaker signal, irrespective of whether it is vertically or horizontally polarised. I suspect that a 45 degree slanted FM5 would also be detrimental to the signal. The mount doesn't really allow for slanted positioning and I am reluctant to spend too much time in the garden at the moment in view of the problems we are having with our neighbours. Actually, this leads me to another question, which I will post next.

Good DX!

John

From: Julian Hardstone
Topic: 30572 Message: 30572

One of our local 'pound shops' has the Television Intelliplug which looked irresistible today. These are intended to turn off the TV and peripherals when you switch your TV to standby, and it seems these have been given away free in the UK by power company Eon in support of the government's power economy scheme.

This could be useful for the typical dx receiver installation using a tuner with remote-control. The Television version Intelliplug comes with a remote sensor on a lead from the plug, and can be switched on by the tuner's remote control or by the button on the sensor. It switches on both the tuner and the peripherals (amplifier and anything else) but only turns off when the tuner is switched off again and the plug senses low power / standby operation; then after about 30sec the intelliplug switches off both tuner and peripherals.

A quick search shows that there are also PC desktop and laptop versions available cheaply, which do not sense the remote control, only the PC power consumption

Sorry to go on about this, but I was looking for an I-trip FM tx device because someone had just told me he got one in his pound store in the Midlands; also I want a couple of F-connector back-to-back adaptors, so a trip to the pound stores seemed in order and I also tried Poundland, maybe tomorrow I'll try Pound World, World Of Bargains and Family Bargains. It's a growth industry ;-)

Hi Julian CPC Preston are doing free postage on online orders at the moment so it might work out cheaper getting F connectors from there.

Andy

@ 45 seconds in there is a very interesting German language accent - Im wondering is it Swiss?

http://www.youtube.com/watch?v=cFUmEpWUN0Q

Perhaps some of the German members can add something. If it isnt Bayern 2, SRF1 with 125 watts would be nice :-)

Interesting accent anyway.

Very interesting, and even more impressing when you can listen to it in such a "best of" form.

That is a strong Bavarian dialect from "Allgäu/Schwaben" area ... Later, at 1:04 it is the same speaker with less dialect, a familiar voice on Bayern 2.
The Italian at 1:57 seems to be a RAI news program.
Interesting to hear some Dutch which mentions Belgium, so might be from Vlaanderen.

73,
Günter

30588. Re: AW: [SkywavesDX] Overnight Meteor Scatter

Yahoo group: SkywavesDX (2014)
Date: 2014-01-20 23:26:41 UTC
From: John Faulkner, Skegness
Topic: 30581 Message: 30588

Thank you Paul and G?nter.

The Dutch station is Klara, fading up on aircraft scatter. Curiously, no sign of this on the horizontal FM5.

Bayern 2 and France Culture were the only two stations to produce RDS.

I can't say I noticed anything unusual about the German at 45 seconds, but I am no expert on language or dialect recognition. A 125 watt Swiss station would indeed be very nice.

Recording these overnight meteor sessions is actually very simple. I record with Bandicam, edit with Sony Vegas, render to a suitable format and then simply upload to YouTube. The whole process takes only a few minutes as I can see the audio of all the meteor bursts on the Vegas timeline, so I don't have to play back the whole recording. I press "S" to snip out the wanted portions of the video, then slide them into a sequence along the timeline. So simple.

Cheers

John

From: John Faulkner, Skegness
Topic: 30590 Message: 30590

Good news. The K?rner 9.2 is available again. I have had a lot of mail about this since getting one a year ago. My initial concerns were the overall appearance and size of this, but as I mentioned back then, the boom is only three or four inches longer than that of the FM5, including the rear reflectors. Figures here: http://www.ham-radio.com/k6sti/korn92.htm

I see there are now two versions:

http://www.antennenland.net/3H-FM-92-shorted-assembled

... plus a kit version:

http://www.antennenland.net/3H-FM-92-shorted-Kit

This is an excellent price for a superbly optimised antenna.

Looks like the beeb have put a filler in manchester to compensate for the qrm from the new CR stns

its Vertical Pol only, about 25watts and site is either 7 sisters tower block or portland tower, fwiw the tx signature has the same instability as 90.1 so my money is on 7 sisters..

Hi Tim I can just about hear R4 on 100.0 during the silent periods from Classic 100.1 Sutton Coldfield but it's very weak so poses no problem for DX.

Also I can only receive it on my vertical dipole.

Andy

Exactly a week ago, 103.6 in Liége was definitely Bel RTL (I was there and listening).
Both websites still show the frequencies as per FMLIST.

Anyone from Eastern Belgium here on Skywaves?

73,
Günter

Thanks Andrew,
it soon goes when i turn the aerial away or flip the polarisation, i think North Hessary Tor will be back when the weather improves, if i've lost truskmore then i can live with that, i was sick of re-logging it anyway.

at least it breaks up the Classic fm part of the band and makes it less boring!

If this is the prefered option for fixing problems caused by badly planned CR stns then we may see
more of these little relays popping up

30603. 100.0, weaker than i thought

Yahoo group: SkywavesDX (2014)

Just to confirm OM JH's observations:
the new BBC Radio 4 relay in Manchester has no RDS subcarrier
I'm viewing the spectrum on the RDR 54D1's waterfall display

just to recap,
TX site is likely Seven sisters tower block in Hulme, (as per 90.1)
(carrier shows same power supply signature as 90.1)
Vertical polarisation only

power is very low, much lower than 25w, maybe as low as 5? definitely
less than 14w (i use the 14w relay @ Llanfyllin as a point of
comparison)

i'm looking forward to seeing if this is logged in Europe via e skip,
it will be much easier to ID than if it were in the normal 92.5-96.1
range where every freq has multiple txs

I don't mind tiny little txs like this, they don't block anything and
they make the band more interesting

I'd like to try to hear this from Long Mynydd in shropshire but i
can't imagine i'll get the chance to go there anytime soon

it will be interesting to attempt reception from beely moor/matlock
forest etc in the peak district

Andrews reception shows that it gets out to the west

Just to confirm OM JH's observations:
the new BBC Radio 4 relay in Manchester has no RDS subcarrier
I'm viewing the spectrum on the RDR 54D1's waterfall display

just to recap,
TX site is likely Seven sisters tower block in Hulme, (as per 90.1)
(carrier shows same power supply signature as 90.1)
Vertical polarisation only

power is very low, much lower than 25w, maybe as low as 5? definitely
less than 14w (i use the 14w relay @ Llanfyllin as a point of
comparison)

i'm looking forward to seeing if this is logged in Europe via e skip,
it will be much easier to ID than if it were in the normal 92.5-96.1
range where every freq has multiple txs

I don't mind tiny little txs like this, they don't block anything and
they make the band more interesting

I'd like to try to hear this from Long Mynydd in shropshire but i
can't imagine i'll get the chance to go there anytime soon

it will be interesting to attempt reception from beely moor/matlock
forest etc in the peak district

Andrews reception shows that it gets out to the west

I went to north Manchester last night and tried 100.0 but nothing but my mates Mercedes has a windscreen aerial and not very good as the radio only receives the strong local stations.

I have checked 100.0 here today but can't hear that signal when I get chance I will drive to a spot where there's no Sutton on 100.1.

Andy

** Personal Skegness 'First' via this mode

I have observed a decline in MS activity today. My chosen frequency to record overnight was 102.0, but it did not reveal much. After recording other reliable frequencies it soon became clear that meteor activity has fallen (here at least) by a large degree. I would estimate by 70 or 80%.

Good DX!

Impressive detective work there Tim. Assuming it's at 7ST, I measure the power difference as ~ -15B, so allowing for errors of ? 3dB that makes the power somewhere between say 1.0 - 2.5W.

I can't see why 93.7 or 94.1 would not give a good service there but next time I am passing I must take a small portable and listen. Maybe there is x-mod between 90.1 and a local pmr

30618. RE: A noisy noise annoys a DXer

Yahoo group: SkywavesDX (2014)
Date: 2014-01-24 18:03:10 UTC
From: <fm104rockinstereo@...>
Topic: 30523 Message: 30618

G'day Nick

I can null out the noise on the 5-element yagi as this is mounted further away from the neighbouring properties, but it is fixed in position (not rotatable) so it does solve all my problems! But it still remains the case with the Korner 15-element yagi pointed to the south, the noise is unbearable on certain frequencies, even off-the-back. This is one of the reasons I continue to predominantly use conventional tuners with narrow filters rather than the XDR-F1HD and XDR-S10HDip - for me, these tend to exacerbate the problem.

Unfortunately ACMA here (the federal regulator of the broadcast / amateur radio / internet spectrum) don't appear to give a toss about interference - even if it is coming from the broadcasters themselves! Effectively you must get two neighbours to also corroborate the interference on any complaint with the official form and with recordings. And I'm not crazy enough to ask my neighbours to do that. :)

Hopefully your interference stays away, at least it is transient by the sounds of it. Keep us posted!

Good DX!

I was able to get France bleu Breizh Izel in the clear a few minutes ago by de-tuning to 93.05 or thereabouts on the T-2. I think Rowridge is on reduced power at present which is helping. Wrotham is at local strength. Guildford also seems to be off or greatly reduced as I'm getting what is probably NHT instead.

Good DX.

Hi Paul,

> Many thanks Gunter, so right next to the Swiss border. Does
> the accent cross the frontier?

Not only Swiss border, but even closer to Austria's westernmost "Bundesland" Vorarlberg, home of Bregenz/Pfänder tx site.

I'd rather call it dialect than accent (but I'm not an expert here). I understand only little when someone talks in this dialect. When the speaker speaks "normal" German, I understand everything, but he still may have an accent which will reveal where he comes from.

> The accent is very particular to my ear, very memorable.

Catching ít over the air is a good "program detail" and helps identifying. You might want to check the various radio websites for programs in "Mundart", and listen to streams or podcasts. Often, music programs with traditional music are presented in dialect or at least with heavy accent. For Austria, that can be found on the ORF Radio Vorarlberg, ORF Radio Tirol, ORF Radio Salzburg and similar channels. For Switzerland, it should be SRF1, and in Bavaria it is Bayern 2.
We might even put together a list of such broadcasts.

73,
Günter

Spain made a bit of a comeback about an hour or so ago. 94.7 Gaztea returned but with weak signal for a few minutes. Also had a weak Spanish speech station on 87.7. I would guess maybe Cadena SER in Galicia, but difficult to tell as it only lasted a minute or two. Just done a quick scan now & nothing, only France popping up on random frequencies.

A pity I didn't have the time to go up to Lynch Hill Park this morning in the car as I think Spain would have been a possibility. No tropo now, and the QRM is back :(

Earlier on (about 4.20 pm) a rather vicious trough went through which would have killed any tropo off. I was at my Dad's at the time in Preston Candover. The rain was torrential and there were some vicious gusts of wind, so much so that they lost power. The temperature dropped about 5C following the passing of the rain. It was 11C with sunshine at lunch time. And there was me thinking that it was supposed to be a nice day.

Good DX.

Also to add some low power French stations like Variation from Guingamp, & MFM from Dian were also received which makes a change from the Inters & France Bleus that always make the first appearance during any tropo.

A storm moved through just south of here during the late afternoon, bringing a chill to the air. It was far from severe though.

I wasn't able to listen until after midday and only caught some of the national TDF outlets in NW France. Then I had to go out just as Nantes had increased in strength on 94.2 to noise free. This was probably my best catch as Nantes is quite a rarity. I didn't hear any Spanish at the time.

Log to follow.

98.0 712km

I didn't start to listen to the radio until after midday, so I don't
know if I missed much before.

Nice to see RDS with these weak/fair signals, something which I never
report much of, unless I have been using the KT6040. Traditionally,
tropo DXing is done with the XDR-F1HD here, which is very poor with RDS,
but the GTK software really comes into its own now.

Tropo conditions didn't take off in any great way here. No Spanish
stations were heard. Nothing from the SW of France either. Mostly it was
just a small enhacement to the bigger TDF outlets in NW France.

88.2 was monitored for meteor scatter overnight but no RDS stored.

Good DX!

You've both mis-interpreted the programme description. JW is playing West Coast American music from late 60s and music inspired by that period and location. The "West Coast" sound is synonymous with the growing popularity of album rock on FM in contrast to Top 40 singles on AM. Does not say he is going to be discussing FM-radio per se of which the music was/is the most important component anyhow.

An hour spent listening to the programme is better than an hour spent listening to Russian Taxis on 10m IMHO :-)

Cheers

Stuart

This Manchester pirate station came on air last night on 101.4 and also has RDS and a PI C080.

This is very strong RDS receivable on all aerials but vertical is strongest and now I have lost Today FM from Ireland.

I have not heard Blitz FM 100.7 for a good while now so I can only presume they have gone.

I was wondering, could it have been a faulty transmitter? I seem to remember the 96.7 Crabwood Farm tx putting out a spur on 94.6 about 9 years ago. The audio on this was very distorted though, as if it was being received on too narrow a bandwidth. I though it was my tuner overloading originally until I heard it on the car radio closer to the tx.

Good DX.

Nick, Whitchurch, Hampshire.

Hi Gunter,

many thanks for the very interesting information on Mundart.

Accent, dialect and language have always fascinated me.

For the non German native speaker that particular dialect really stands out.

I found also this interesting map on the subject
http://upload.wikimedia.org/wikipedia/commons/0/0c/Oberdeutsche_Dialekte.png

In my county (population only 60,000) there are at least 4 accents and two dialects (of English) going on! It makes for interesting listening With English influenced by Irish (Gaelige) and Scots (dialect of English) - it is not unusual to hear a sentence with words from all three included!

It is almost never heard on TV or radio since both those mediums tend toward standardisation.

Its good to see that dialect is still making it onto radio where you are with Plattdeutsch and even Yiddish.

I will have to tune in and have a listen.

Paul

Hi Paul,

> Many thanks Gunter, so right next to the Swiss border. Does
> the accent cross the frontier?

Not only Swiss border, but even closer to Austria's westernmost "Bundesland" Vorarlberg, home of Bregenz/Pfänder tx site.

I'd rather call it dialect than accent (but I'm not an expert here). I understand only little when someone talks in this dialect. When the speaker speaks "normal" German, I understand everything, but he still may have an accent which will reveal where he comes from.

> The accent is very particular to my ear, very memorable.

Catching it over the air is a good "program detail" and helps identifying. You might want to check the various radio websites for programs in "Mundart", and listen to streams or

podcasts. Often, music programs with traditional music are presented in dialect or at least with heavy accent. For Austria, that can be found on the ORF Radio Vorarlberg, ORF Radio Tirol, ORF Radio Salzburg and similar channels. For Switzerland, it should be SRF1, and in Bavaria it is Bayern 2.
We might even put together a list of such broadcasts.

73,
Günter

I didn't manage the Spanish reception - the terrain is poor in that direction - but I did get quite a few French transmitters the best being Partheney at 519 km. (FM5 at 24ft agl fixed in southerly direction). Most of the TX's at Lille and Egem were coming in with 0%ber on the RDS Spy along with lower powered coastal stations.

What I have noticed over the last few days is that there is some good weak tropo-scatter about - despite the bad weather. MDR Figaro on 87.9 was coming in weakly just now - and also yesterday after the storm front had cleared. HR3 from Sackpfeife (544km) on 87.6 comes and goes with Nostalgie and/or RTBF Classic 21 from Leglise and a fair number of the closer German stations in the 400-500km range are there

http://youtu.be/GTDDALIc2ro

This recording is in two parts:

Firstly, on 96.4, you will hear some nasty noise bursts which I have been getting on various frequencies across FM. These noises have been appearing for a few weeks but are steadily getting worse. Does anybody know what they might be caused by? Sounds like the sort of interference I used to get on 2m FM when I lived in Sutton In Ashfield.

Secondly, on 94.7, a burst of France Musique from Lille. This kind of sudden fading is typical of almost all continental signals since I started listening on the garden FM5 antenna - it's still at one metre above the ground. Earlier this afternoon I was receiving even more impressive sudden bursts like this from RTBF Classic 21 from Anderlues. This second part demonstrates the difference in noise pick-up between the garden FM5 and the rooftop 9.2. It's not the best example as the FM5 is also picking up some noise today, but it demonstrates the importance of having good signal-to-noise, rather than gain, gain and more gain.

John

Definitely multi-hop Es.

For it to be F2:

1. We would need a very high solar flux (peaking high 200s at least.

2. We would need to be at a time of year when transatlantic MUFs are at their highest - i.e Autumn, or perhaps late winter.

I remember reading of a 50/70Mhz F-Layer crossband contact during Cycle 21 between VE1YX in Halifax, NS and a UK station (I think it was G4GLT, can't remember 100% without going into my loft and digging out RadComs of 1979-82 to find the exact info), but nothing of that nature in Cycles 22 or 23.

Any propagation on 6m and above in summer across the pond would be multi-hop E layer.

Jim.

Those QRM bursts do sound like electrical arcing from HV powerlines and as you have some 11 kv lines in the field 75 yards to your south.

I had this problem in 1980 from 11 kv powerlines it used to wipe band 1 out completely every evening presumably due to the voltage rising as it does at night.

This did not happen when it rained which I prayed for anyway it was traced to a faulty insulator 300 yards away.

Another source of that type of QRM is welding rigs being operated close to you.

been getting on various frequencies across FM. These noises have been
appearing for a few weeks but are steadily getting worse. Does anybody
know what they might be caused by? Sounds like the sort of interference
I used to get on 2m FM when I lived in Sutton In Ashfield.

Secondly, on 94.7, a burst of France Musique from Lille. This kind of
sudden fading is typical of almost all continental signals since I
started listening on the garden FM5 antenna - it's still at one metre
above the ground. Earlier this afternoon I was receiving even more
impressive sudden bursts like this from RTBF Classic 21 from Anderlues.
This second part demonstrates the difference in noise pick-up between
the garden FM5 and the rooftop 9.2. It's not the best example as the FM5
is also picking up some noise today, but it demonstrates the importance
of having good signal-to-noise, rather than gain, gain and more gain.

John

30671. Weak Tropo-scatter Reception

Yahoo group: SkywavesDX (2014)
Date: 2014-01-27 15:17:26 UTC
From: <davebunyan@...>
Topic: 30671 Message: 30671

Overall tropo conditons are poor today - barely getting anything from the usual locations of Egem, Lille or Goes and even Dunkerque is quite noisy.

Despite that weak trop-scatter in the range of 600+km is present - as it has been in recent days.

14:16-14:20 93.1 Bayern 2 Kreuzberg at 656 km
14:27-14:28 95.0 hr-info Rimberg at 611 km

Also a number of closer in German stations in the range of 450-490km, along with RTL Luxembourg on 88.9 (432km).

It can be a bit of a waiting game for signals to fade up an clear frequencies - but fascinating. I may be wrong but it seems when the atmosphere is churned up - longer distance week scatter is more prevalent.

Thanks Andy.

That's rather worrying if it is related to the nearby power lines. If it is them I can say they have never been a problem until now. I purposely checked to see how noisy they were before we moved here, and they were fine. I even ran a 300m medium wave beverage underneath this a couple of years ago and there was no noise whatsoever.

If the problem is a faulty insulator then it's bad news as I remember your story about having to wait 18 months before it was replaced.

We are hoping to be moving soon so I hope we are able to find somewhere which is electrically quieter.

No welding equipment in this area, or any other similar industry, by the way.

Thanks

John

Hi Paul/Jurgen,

I learnt "1960's" dutch in the seventies from Linguaphone records and then topped it up with the 1980's CD version and some other stuff along with watching Satellite TV. Made my Flemish relatives happy to be able to hold some sort of conversation - and I was good enough to be mistaken for being Belgian when I went to Dordrecht around 1992. (My mother actually told me much later that when I'd tried to speak a little bit of dutch when I was first learning - that I had the ear for it).

I then tried my hand at learning German - from Linguaphone and would estimated that 80% of the words were 'the same'. Where dutch used a "d" the german used a "t" for example drinken/trinken and "w" became "v".

I tried hard to learn all the "die, der, das, diese, mein, meiner, meinem" but in the end I just gave up when the 9th lesson introduced a whole new level of gender dependent words to learn. Mind you I managed to retain enough when I visited Stockstadt in 2005 to get by with - and Bavaria in January with snow on the ground was a beautiful sight when travelling through it on the high speed train.

I find it easy to recognise the sound of Dutch, German, French and Scandanavian languages. Also not to bad for Spanish and Italian and "Eastern European and 'arabic' - but believe it or not the worst one to distinguish on a weak signal is - English! It always seems muffled to me and needs a higher signal level than the others. Maybe it's because I'm half Flemish :)

30674. Help with possible German ID please

Yahoo group: SkywavesDX (2014)
Date: 2014-01-28 00:35:38 UTC
From: John Faulkner, Skegness
Topic: 30674 Message: 30674

I have been delving more and more deeply into meteor scatter, recording the web audio streams of chosen radio stations, then synchronising my recorded audio in order to see if a signal pops up on the frequency which matches the web streams. Sometimes I need to hear more than one burst of a station in order to be sure I have a match as short pings are not enough.

Using WaveLab, my old audio production software, it is possible to see the pings and bursts and home in on them instantly, thus removing the need to sit through hours of audio. It is working well, though the possibilities are somewhat limited as the recorded files are huge in size and can take a lot of time to process beforehand.

This has been an eye-opener. What has surprised me is that low power transmissions seem to be just as likely to be heard as higher powered ones, though I wouldn't expect a flea-powered transmitter to provide enough signal for RDS.

Sometimes a lot of luck is necessary, especially if an ID is to be caught.

This evening, I think I may have heard an ID from a German station on 93.4, but the meteor burst is barely more than a quick ping, however I am sure I can hear a Delta Radio ID. This would be a 2kW transmitter from Hamburg. Could any our German members please listen and, hopefully, you might recognise this as an actual ID. Here is the video link.

http://youtu.be/u50BLxlJeSg

Also in the video is a burst of aircraft scatter from Nostalgie in Lille, also on 93.4. It never fails to amaze me how a signal can suddenly appear from nowhere and reach virtually noise free levels in a second or two.

Apologies for selecting the wrong aspect ratio. I am still getting used to Bandicam.

Thanks

John

Insulators can go faulty usually Lightning damage or someone using it as target practice or age.

Also when we have storms like the recent ones muck in the air gets on to the insulators and arc until the rain washes the muck off them.

This is what used to happen at the pole behind our property but I suffered no problems from that it was the pole 300 yards away and was subject to target practice as it was next to a park.

The QRM problem I had from the insulator only affected band 1 band 2/3 was ok so it shows that these problems can be frequency conscious.

It took 18 months for my problem to be rectified and energy was cheap compared to today and the district network operators don't like power leaking away as it costs them money so today may be quicker to respond.

Thanks for the info Andy.

I keep checking the reception on the 9.2 and it seems to be constant now. Vertical was much worse today and from a slightly different direction. It's now up to 30dB too so the 9.2 is currently a no-go. Even the FM5 on the garden is getting a little of it.

Cheers.

John

Paul,

Mostly OT, The Bridge is a great drama series. Of course it's just a story... the mutual comprehension between the two languages is not quite there in real life.

But try listening to Danish at half speed and it becomes much more Swedish-like. The same thing happens when you play back Estonian in slow mo - it becomes more Finnish!

Linguistically the southern conterparts of these closely related language pairs are more "degenerated"; they have been worn out in more frequent use (maybe because of a higher population density). Hence all kinds of word endings are cut out and half of the rest gets swallowed... ;)

Eklipse will be on DAB via the central Scotland local multiplex. They don't have an FM licence, so the reference to FM on their web site is a puzzle. Perhaps they plan to take out a temporary FM RSL licence somewhere when they launch, probably in Glasgow where they are based, but it would only be on the air for up to 28 days and with a maximum of 25 watts... 73s Dave

Hi Jukka,

watching that show got my interest going and I did some reading about the various Nordic languages.

On the following page there are some results from a study taking in Sweden, Norway, Denmark, faroe Islands, Iceland

http://en.wikipedia.org/wiki/North_Germanic_languages

It is interesting that between Copenhagen and Malmo mutual comprehension
(on a scale of 1 to 10) was rated at 5 but between Copenhagen and Stockholm it dropped to 3.4

Residents of Oslo seem to come off best in comprehension of both Danish and Swedish for some reason.

Interesting what you say about slowing Danish or Estonian to half speed!

To me Danish sounds very different to Swedish, instantly recognisable, and as you say "faster".

Paul

Paul,

Mostly OT, The Bridge is a great drama series. Of course it's just a story... the mutual comprehension between the two languages is not quite there in real life.

But try listening to Danish at half speed and it becomes much more Swedish-like. The same thing happens when you play back Estonian in slow mo - it becomes more Finnish!

Linguistically the southern conterparts of these closely related language pairs are more "degenerated"; they have been worn out in more frequent use (maybe because of a higher population density). Hence all kinds of word endings are cut out and half of the rest gets swallowed... ;)

Band 2 Meteor Scatter:
88.1 1034 I RAI Radio1, Several listed including three high power OM news, as web. Frequent bursts **
88.1 1250 SRB Radio Beograd 1, Ovcar (Srb) Don McLean song, as web 1779km **
88.1 1306 SUI RSI Rete Uno, Monte San Salvatore (ti) Sades Paradise, as web stream 1010km **
88.1 1312 G BBC Radio 2, Several Sites possible Maybe North Hesssary Tor? A fluttery Jeremy Vine! **
87.6 2111 D Antenne Brandenburg, Frankfurt (Oder) Boo?en (brb) Neil Diamonds I Am I Said, as web. Two second burst 951km **

** Personal Skegness 'First'

Poor meteor scatter yesterday but much better today. It's been 'pings' rather than 'bursts' but there were a few longer ripples of activity lasting up to about five seconds during the last few hours of the day.

Good DX!

Sounds like you've got something to give a new boost to your enjoyment of FM-DXing - I admit to not having the patience to go to the length of recording various web streams to synchronise them with received bursts - but it's the sort of thing that reveals just how fascinating propagation is and just how little power is needed.

At the moment - whilst working/surfing on the computer I've got the radio tuned to 88.9 - and RTL Luxembourg came up noise free for about a minute with pi code before fading back again.to noisy intermittent reception. and it is fascinating how you can get completely different stations on the same frequency over a period of time.

Weather is atrocious - heavy rain yet again - the garden is so saturated that puddles are forming on the lawn. Despite this tropo-scatter to Germany is still evident with SWR3 from Koblenz (490km) on 91.6.
coming through and getting up to noise free mono. and NDR Kultur from Linz (471km) on 90.2.

Good MS DX

Yes, it has indeed opened up a new window of opportunity, for as long as it lasts. The problem with recording audio streams is the setting up times. There are ways of doing this which, in theory, are very simple, though complications set in when you realise that there different bitrates and streaming formats, there are also different sample rates and converting these for playback can be a nightmare, not to mention time-consuming. It can take five minutes to convert a three hour recording. Then the more you have ... etc.

It's easy to see the visualisations of the bursts once everything is loaded in and synchronised, but even here, dealing with huge file sizes and then having to convert them can be a headache. I haven't found a single method which is simply 'click and go'.

There are some points you need to consider when checking for web parallels, which I have touched on before. Say I hear a station fade up playing that irritating Get Lucky song or the latest Martin Garrick hit, etc., it's possible that two or more stations could be playing the song at the same time. I hear this often. I won't make a logging on the basis of hearing a ping of a current top ten song unless there is some other clue. Virtually all the meteor loggings I make include more than one burst, so you can often pick up more than one song, or there will be some other indentifiable feature which nails it. Listening late in the evening is a no-go too due to networked programming. If there's any doubt I will always state "presumed", etc. I thik it's fair to say that nothing is 100% foolproof with meteor scatter, but common sense should tell you what you need to know. /I need some common sense now. //;O)/

Cheers

John

I kept an eye on 90.2 overnight. 100%NL from Roosendaal kept taking over and there were only a few decent bursts.

I hear what sounds like "BFM" or "Big FM" at 38 seconds but cannot see anything listed which matches. Maybe somebody knows more.

http://youtu.be/aVDuY0MAlfM

Thanks

John

Hi John,

around 0:54 you can hear a short burst from an italian catholic radio, broadcasting a peculiar prayer called "Le Lodi".
Very probabilly it's Radio Maria who broadcats "Le Lodi" after 7:15 UTC.

Franco

Thank you very much Franco.

I had Radio Maria down as a very likely candidate. There is a 1kW transmitter at Alassio. Also listed is Conversano but the power for that transmitter is not stated.

With you mentioning their programme "Le Lodi" I think that makes this as good as 100%.

Thanks again and good DX!

Hi John,

Your logs are now looking more more like they did a couple of years ago - when I first came into the hobby.

I think you should experiment with a fixed bandwidth, rather than autobandwidth - I believe you can set something like 143KHz. I've got my Yamaha TX-930 set up with 2x150khz and 2x110kHz and I definitely lose RDS sensitivity in narrow setting. And that's one of the things I really like about the tuner - a front panel bandwudth button.

To give two examples

BBC R Kent on 96.7 - in wide setting it takes 2 seconds to get PI and 3-4 seconds to get PS in wide mode. In narrow mode it takes 5 seonds for PI and no PS.

Southend Radio 105.1. Wide - 1-2secs for PI code and a long time for PS to slowly fill in (%BER is over 75%). Narrow-.can take over 10 seconds and RDSSpy only syncs intermittently.

So I think you should get more RDS hits - on the assumption that "auto bandwidth" starts off in narrow setting..

Good MS DX

David

Hi Dave.

Yes, I am really enjoying the meteor scatter side of the hobby once again.

I tried lots of experiments, using different transmitters, changing the bandwidth, but it didn't resolve any RDS more quickly. I found 156 kHz to be the best manual bandwidth. The differences were marginal, so much so that it wasn't worth worrying about.

I realise that the XDR will gradually widen depending on the strength of the signal, so there could be some benefit to being in wide to begin with. With this in mind I also switched the antenna in and out while making these observations, firstly in auto, then in a fixed bandwidth. Again, I did not see any clear advantage, though the RDS response might have been fractionally quicker 'at times', but not always. It certainly worth doing, but only when I am not on a frequency which is adjacent to a stronger transmitter.

I haven't had any RDS storing on the display from meteor scatter. The frequency of the pings and bursts is getting less and less. I recorded 88.3 and 87.6 overnight but I am yet to go through the files. I have three four hour files on which I am having to convert the sample rate before I can even load them into the multitrack editor. It's taking about 15 minutes for each file. There are more to convert, so you can imagine the preparation involved for this. I can let the computer batch convert luckily, so I can get on with something else. I am really throwing myself into this as it's throwing up all kinds of interesting results I never expected. It's well worth it. Give it a try.

Regarding more regular loggings a couple of years ago. I try not to be too repetitive, but it's no doubt interesting to some to see how general aircraft scatter varies here from day to day. I was up early this morning and conducted a very quick bottom-to-top bandscan, logging the results on FM List. I will do a few more of these to show what is possible here during these poor mid-winter conditions. Yesterday, I had nothing at all from the continent.

Time is probably not going to be on my side in the weeks ahead due to a possible move. We are stung by the bedroom tax and other charges since Jane and I got married last summer. She is disabled so we are being quite badly hit thanks to that nice Mr Cameron. What is making things more frustrating for us (forgive me if I have already mentioned this - I really don't know what I am doing at the moment) is our neighbours, who are being complete bastards. We are experiencing some damage to the property. The car windscreen was put through yesterday. I can add many other events, such as, cutting the mains earth to the property, knocking

a friend unconscious, damage to CCTV and garden property, damage to aerials and cables, burning our garden fence, two break-ins to our garden shed (caught on camera). I could go on. There are MANY more things, all documented, some with video evidence, all reported to the police, yet there seems to be little we can do about it. Oh, we must have done something to cause this. Honestly, we haven't done anything. The neighbour even helped me concrete aerial mast bases into the ground when we moved in. It's all very odd, but we have seen that there is some activity they are up to which they don't want us to catch on camera.

Cheers!

A rather stressed John

(wal-nam) 441km

*** Personal Skegness 'First'*

This is a more complete picture of today's scatter.

I recorded 88.3 and 87.6 overnight for meteor scatter. I included duplicate loggings to show how regular some signals have been.

The aircraft scatter log was based on a quick scan from the bottom to the top of the band including all continentals I heard in a single sweep. This is the first time I haven't included programme details for reasons of quickness.

Good DX!

In reference to your low-end FM interference.

Does the QRM increase when you aim your roof
top Korner 9.2 towards the problem neighbors house?

If so, take a portable AM radio and tune it down to the
low end where there are not stations then walk along
the neighbors properly line, front, sides and back
(stay on public areas) and note the spot of the maximum
arcing bursts.

After that report it:
http://consumers.ofcom.org.uk/tell-us/tv-and-radio/tv-or-radio-interference-or-reception-problems/http://consumers.ofcom.org.uk/tell-us/tv-and-radio/tv-or-radio-interference-or-reception-problems/

>I realise that the XDR will gradually widen depending on the
strength of the signal, so there could be some benefit to being in
wide to begin with. With this in mind I also switched the antenna in
and out while making these observations, firstly in auto, then in a
fixed bandwidth. Again, I did not see any clear advantage, though
the RDS response might have been fractionally quicker 'at times',
but not always. It certainly worth doing, but only when I am not on
a frequency which is adjacent to a stronger transmitter.
>
>I haven't had any RDS storing on the display from meteor scatter.
The frequency of the pings and bursts is getting less and less. I

recorded 88.3 and 87.6 overnight but I am yet to go through the files. I have three four hour files on which I am having to convert the sample rate before I can even load them into the multitrack editor. It's taking about 15 minutes for each file. There are more to convert, so you can imagine the preparation involved for this. I can let the computer batch convert luckily, so I can get on with something else. I am really throwing myself into this as it's throwing up all kinds of interesting results I never expected. It's well worth it. Give it a try.
>
>Regarding more regular loggings a couple of years ago. I try not to be too repetitive, but it's no doubt interesting to some to see how general aircraft scatter varies here from day to day. I was up early this morning and conducted a very quick bottom-to-top bandscan, logging the results on FM List. I will do a few more of these to show what is possible here during these poor mid-winter conditions. Yesterday, I had nothing at all from the continent.
>
>Time is probably not going to be on my side in the weeks ahead due to a possible move. We are stung by the bedroom tax and other charges since Jane and I got married last summer. She is disabled so we are being quite badly hit thanks to that nice Mr Cameron. What is making things more frustrating for us (forgive me if I have already mentioned this - I really don't know what I am doing at the moment) is our neighbours, who are being complete bastards. We are experiencing some damage to the property. The car windscreen was put through yesterday. I can add many other events, such as, cutting the mains earth to the property, knocking a friend unconscious, damage to CCTV and garden property, damage to aerials and cables, burning our garden fence, two break-ins to our garden shed (caught on camera). I could go on. There are MANY more things, all documented, some with video evidence, all reported to the police, yet there seems to be little we can do about it. Oh, we must have done something to cause this. Honestly, we haven't done anything. The neighbour even helped me concrete aerial mast bases into the ground when we moved in. It's all very odd, but we have seen that there is some activity they are up to which they don't want us to catch on camera.

30710. Re: [SkywavesDX] RE: Neighbours / Noise

Yahoo group: SkywavesDX (2014)
Date: 2014-02-02 11:46:47 UTC
From: John Faulkner, Skegness
Topic: 30696 Message: 30710

Hello Mike.

I have already been down this road. OFCOM have been here four times before Christmas. They spent a long time studying the noise but were unwilling to investigate the source. The only thing they did was to drive up and down the road to see if they could detect it, but they said they couldn't detect any. They could see it clearly here, especially when they plugged the 9.2 into their equipment. They agreed it was strong but, because the problem was not severe enough to degrade reception of my local Belmont transmitter, they were unwilling to take it any further. One of the three men who visited sympathised as he was a radio ham too.

There is no way I am taking a radio up and down the street to locate the noise in view of the problems we had here yesterday. The neighbour took down the garden fence, the reason we still don't know, and we had an almighty row, all of which was caught on video and handed to the police - the fourth time we have seen them in less than two weeks. How things didn't come to blows I will never know. The situation is out of control and is starting to make us ill. Although we are actively seeking a new property, we are struggling as there are very few available due to recent local flooding problems. People are being temporarily accommodated in them while their own homes are being repaired. When it rains, it pours here, quite literally in recent weeks.

John

30711. For Sale - Tecsun PL390

Yahoo group: SkywavesDX (2014)
Date: 2014-02-02 14:45:02 UTC
From: John Faulkner, Skegness
Topic: 30711 Message: 30711

?35 - as new. Immaculate condition. Box, etc. etc. Only used once or twice briefly for OIRT band.

Includes OIRT band.

I will paste some info below. All facts correct.

Features:
FM Stereo / MW / LW / SW (2.3~21.95 MHz) World Band. Several Tuning Methods: Easy Tuning Mode (ETM), Auto Tuning Storage (ATS), Direct Keypad entry, Auto scan tuning with few seconds pre-listening for both frequency & memory (VF/VM), Manual tuning.
ETM is the unique tuning method designed by Tecsun. It skillfully combines the reception circuitry & control procedure to pre-select the suspected radio station and temporarily auto stores them into the ETM memory (not the regular 550 memories). This highly enhances the efficiency when tuning into radio stations.
The tuning knob has Auto Speed Changing allowing precision tuning
550 Station memories (100 presets for each FM / LW / MW and 250 presets for SW)
LCD displays the Station Frequency, Signal Strength, Temperature, Battery Consumption and Clock etc.
Digital volume control with 30 adjustable levels.
Sleep timer function (1~120 minutes)
Alarm by radio (adjustable alarm stopper within 1~90 minutes) or Alarm by buzzer
Built-in Dual Speaker
Line-in socket (can be connected with other forms of media functions as a stereo Speaker)
Built-in rechargeable function via USB jack (5V)
Operated by 3 x AA batteries (excluded) or external adaptor (excluded)
Unit size: 186X89X29 mm

POWER SOURCES
Operated by 3 x AA batteries (excluded) or external adaptor (excluded)
Built-in rechargeable function via USB jack (5V)

PACKAGE INCLUDED
1x PL390 Radio
1 x Pouch with wrist stripe
1 x stereo earphones
1 x wire antenna
1 x line in cord
1 X English Manual

Cheers

John

It was the turn of 88.2 overnight. There were lots of classical music bursts but due to shared programming it was not possible to be more specific which station it was, but both NDR Kultur and Bayern 2 came in numerous times, including NDR Kultur with an actual vocal ID.

Signals would have been sufficient to produce RDS but I didn't use Bandicam overnight as this poor computer is being pushed to enough extremes with dozens of huge audio files as it is (and it's starting to buckle). What I find amazing is that there are so many different stations coming through, it's impissible to make any guesses. It seems that it's mostly the more powerful transmitters are producing the RDS while the lower powered transmitters are still pushing through with great ease.

Once again, I have logged ALL instances of identified meteor scatter just to show the regularity of the signals. Quite amazing stuff.

Good DX!

I included all meteor loggings from the first hour of my recording. Note
how many times the same three transmitters are received. There would
easily have been around 100 entries of duplicates from Strasbourg,
Chemnitz and Kosice. Pings and bursts were fast and furious from these
transmitters for the first hour or two of the night, but there were
still plenty of bursts from unidentified stations and I recorded 20
streams overnight. The methods I use are now becoming much simpler to
organise regarding the sample rate conversions from the various web
streams. Is this all a bit OTT? Yes, quite probably, but it's good fun
at the moment.

Good DX!

that laser type sound effect they use as a "sting" really cuts through
the splatter and mess at low levels

worth a try in the midlands/north unless you have a blow torch on the freq

also, sting fm have a left a blank carrier on

30721. Fitting the radio hobby in with the rest of your life

Yahoo group: SkywavesDX (2014)
Date: 2014-02-04 22:46:59 UTC
From: <tanger32au@...>
Topic: 30721 Message: 30721

This applies to any area of the radio hobby, if this is amateur radio, shortwave listening, radio scanning, ultralight DXing or any other area. It becomes more of an issue as your other responsibilities taken over and other people / domestic harmony need to be considered.

I am very interested to get a discussion going on how we each manage this and any issues we have found, some general questions to get the discussion started.

- Do you set aside a specific time / day regularly for your radio hobby?

-Do you generally try and fit your radio hobby around the rest of your life or your life around your radio hobby? This may be more important where other people are involved and you need to fit in with them either way.

- How supportive are your family, friends and co-workers with your radio hobby and is it something that is seen as a part of your family life or is it something that is more hidden away and not really supported / understood by them?

- Would you ever consider making a major decision due to how other people feel about your hobby such as ending a long-term relationship if the other person didn’t support your hobby and didn’t want you to participate in it?

- Any general tips or advice on the ways you combine your radio hobby with the rest of your life?

Regards
Paul

** Personal Skegness 'First'

This is becoming more and more addictive. Two sessions recorded this morning, both focusing on 107.6. I omitted most of the repetition today.

Big FM from Bornberg was the dominant station, although Antenne Thuringen and B5 Aktuell appeared frequently.

Despite recording 20+ of the highest powered streams again I found several stations popping up which were not in parallel with any of them.

A mystery classical music station was also quite frequent. I suspect this will be Hungary's Bartok, which I did not record.

Good DX!

From: John Faulkner, Skegness
Topic: 30721 Message: 30723

/- Do you set aside a specific time / day regularly for your radio hobby? /

Yes. All of it! ;O) Well, as much as I can, within reason. I go by conditions. If the conditions aren't there then I avoid radio because I know there will be some point when radio is good and I will want to devote more time to it. Lately I have been DXing around the sunrise period as that seems to be the best time for scatter. My recent modification to the F1HD and the addition of the garden antenna have opened up new possibilities. I must admit I am really hooked at the moment.

/- Do you generally try and fit your radio hobby around the rest of your life or your life around your radio hobby? This may be more important where other people are involved and you need to fit in with them either way./

No, I do my utmost to fit the rest of my life around my radio hobby, if at all possible. ;O) Seriously, I am not particularly selfish this way. Other, important things do take precedence when necessary. Radio DOES come second and these days I find I am more able to walk away from a good DX opening if there is something else important happening.

I wonder if I may have another blow-out one day. This happened to me in 1987 when I suddenly lost interest in every aspect of the radio hobby. Looking back I cannot see any reason for this, other than a natural loss of interest. This lasted until 1995 when I regained my interest. Weird!

/*- How supportive are your family, friends and co-workers with your radio hobby and is it something that is seen as a part of your family life or is it something that is more hidden away and not really supported / understood by them?*/

My parents, who are sadly no longer around, were hugely supportive of my hobby as they themselves were both wireless operators, stationed at RAF Bawtry Hall in Nottinghamshire during the second world war. My father wanted to become a radio ham but never realised his goal. He bought a Trio 9R59D to listen, though I did far more listening on it. That old valve radio still sits with me on my radio desk today.

i am lucky when it comes to my wife as she is also a radio ham, though she hadn't done any operating for a couple of years. She plans to take it up again once we've moved and she enjoys reading through radio magazines. We were married here on the beach last summer and planned to make it radio themed somehow, but this never happened. We had plans to involve one of the local radio clubs but we had drifted away from them after a year or two. Our honeymoon was spent camping in Cornwall and here we even took along some radio gear, though very little time was

spent playing radios in favour of more traditional holiday type activities.

/*- Would you ever consider making a major decision due to how other people feel about your hobby such as ending a long-term relationship if the other person didn’t support your hobby and didn’t want you to participate in it? */

Wow, that's a very difficult one. Naturally, relationships should ALWAYS take precedence, though it didn't in my former marriage. My ex wife had no concern whatsoever for the hobby or anybody in it. She HATED the whole thing. I ended up hating her, not because of her disregard for the radio hobby, but she became very bitter towards anything and everything, not even her own family. We just drifted apart. I realised I had my life back the day she walked out on me and heaved a huge sigh of relief. She beat me to it as I was on the verge of walking out myself. As it happened, she walked out on the day of my mother's funeral and I was quite devastated as a result, but I knew her leaving me was for the best. I haven't missed her once. My relationship with Jane is completely different. We are 100% committed and closer than close thing.

/*- Any general tips or advice on the ways you combine your radio hobby with the rest of your life? */

As I mentioned above, don't blow out on radio activity when conditions aren't good. Save that time for a good DX opening. You shouldn't ever overdo it regarding broadcast DXing as there are relatively few days in the year when the DX is completely unmissable. The main stumbling block here would probably be the sporadic E season which can take up a lot of your time. I had no problems last season and managed the time well, but the year before I spent far too much time monitoring the conditions. Never neglect your family and friends. Strike a sensible balance. Easy to say, but in this day of automated DXing, it should be relatively easy to walk away from a great DX opening and let the radio to DX by itself. Does that mean radio still takes precedence? Hmm. I'll let you decide that one.

John

30724. Two Questions

Yahoo group: SkywavesDX (2014)
Date: 2014-02-05 11:39:55 UTC
From: John Faulkner, Skegness
Topic: 30724 Message: 30724

As I have mentioned the other day, we should be moving house shortly. Two questions are burning in my mind, the first of which is important to the hobby concerning potential interference.

We are looking at potential properties which use a form of heating called "Air Source Heating". I have never heard of this and have done some research. It seems to be a kind of air conditioning which involves a pump. There is a Wiki which explains a few things.

http://en.wikipedia.org/wiki/Air_source_heat_pumps

I was wondering about the likelihood of this kind of heating being an interference source. Does anybody have any experience or knowledge?

The second question is a small point regarding starting new logbooks from scratch. When we moved from Nottinghamshire to the east coast I started new accounts in FM List and created new personal logbooks. With reception being so different here it seemed like a good idea to begin a new logbook and separate the old loggings from the new. Another consideration was moving into a new ham radio locator, or "square". This is more relevant to amateur radio as this will make a big difference to a ham radio logging. But what about broad cast DX?

Doing this by the book, I probably ought to start a new logbook if we move to a new square, even if within Skegness as there are six in the immediate central area. If we moved outside Skegness, let's say closer to Boston to the south or Cleethorpes in the north, should I begin from scratch again? I am inclined to think that I should. But what would you do? Is there a right and a wrong way to do this, 'officially'?

Please let me know your opinions.

Thanks

John

Not to worry. We have been looking at a bungalow today. It's detached so no neighbours joined on, plus it's well screened from nearby properties too so no hopefully no nosey neighbours. The heating is standard gas and it's even in the same grid square. Problem solved.

John

** Personal Skegness 'First'

Poor aircraft scatter conditions today. Perhaps not surprising considering the atrocious weather. The winds didn't batter the east coast too badly overnight but I understand there is a more vigourous storm system working its way across the Atlantic for Saturday.

On the meteor side, one of the NRW local stations was a regular visitor to 107.4, but since there are several stations which carry the same overnight programme it is impossible to know which one/s were received. Radio Wuppertal was spotted later, however, with a local female presenter which wasn't in parallel to the others (Lippe, etc.)

Another one I'm fairly sure I heard several times this morning was Antenna Karnten from Spittal (2.7kW) but the pings were just that little bit too brief to be 100%. Maybe next time.

Good DX!

Date: 2014-02-06 08:29:07 UTC
From: John Faulkner, Skegness
Topic: 30728 Message: 30728

.... but not now at 0825.

I was up briefly at 0600 and checked the band. There seemed to be European scatter (principally Holland and Belgium) on every frequency. Assuming it would still be around an hour or two later I went back to bed, very tired and thinking about the house move we now have. But it's now 0825 and I hear a very flat band. The timing on these sunrise openings is critical.

Good DX!

John

I would have thought that the most important question is - are you allowed to put up a 'decent' aerial - what is the 'take-off' and what is the general level of interference?
Before you sell your PL-390 I'd use it to monitor the sort of noise levels you get - and if you have a reasonable garden - can you again find a noise-free location?
With no actual experience of ASHP - I would only venture to suggest it should be no different to fridges/central heating as all motors should have interference suppression - again the portable radio will help you find out.

Hope your move goes well in all aspects.

David

30730. Re: [SkywavesDX] RE: Two Questions

Yahoo group: SkywavesDX (2014)
Date: 2014-02-06 13:31:28 UTC
From: John Faulkner, Skegness
Topic: 30724 Message: 30730

You're not wrong Dave. Radio matters first! ;O)

We drove up towards Cleethorpes yesterday to look at a property which had the ASHP heating. We never actually got there as we received a phone call half way there from the housing who told us they had found us a place in Skegness. This one has standard gas central heating. It's a detached bungalow, so no neighbours poking their noses over the fence. It's virtually cut off from all potential prying eyes by tall conifers or high fencing. It is offset in such a way that no other property looks directly in. It's less than a mile from the sea too.

I visited twice yesterday, once mid-afternoon and again mid-evening, a modified and very sensitive Degen DE1103 in my hand, just to test for noise. There was no noise at all on MW or band 2. I was surprised how clear the band was and what was getting through. Comparing this with reception on the garden back at home showed just how bad things are here. The Degen picked up plenty of noise which buried the stations i was receiving at the new property. I am surprised the FM5 does so well, but that is directional. I don't think anybody is exempt from noise these days. It's a ticking time bomb for us all.

No doubt there is plenty of potential for noise though as there are lots of other houses nearby, but none are adjoining and all are separated by footpaths so we are slightly further away from 'people'.

I have already seen where the 9.2 will go. Hardly anybody should be able to see it, plus we already been told there won't be any problem to have the 9.2 installed there.

There is a large garden surrounding property, two long ones, both three or four times the length of this one, plus bits at the sides and our own drive so there's heaps of room for concealed antennas.

Congrats on getting that property :-) This is very good news for you both. I am glad that this has all worked out for the best. Fingers crossed you get better DX conditions at the new house.

As for noise, after a lull between around January 27th and February 3rd, my noise problem is back again. It seemed slightly more intrusive when it started on the 3rd for some reason. So there are going to be changes to the aerial set-up here within the next few months. I hope to get all this done in time for the Es season in May. It'll involve a bigger aerial, higher up on a rotator with better quality coax. I'm hoping this will minimize the disruption that the noise causes, as well as opening up more DX.

Good DX.

Nick, Whitchurch, Hampshire.

Yamaha T-2, Denon TU-800L, Kenwood KT-1100SD (modified), Yamaha T-85, Sony XDR-F1HD tuners, Triax FM5 horizontal beaming east.

On Thursday, 6 February 2014, 13:31, "John Faulkner, Skegness" <john.faulkner@...> wrote:

You're not wrong Dave. Radio matters first! ;O)

We drove up towards Cleethorpes yesterday to look at a property which had the ASHP heating. We never actually got there as we received a phone call half way there from the housing who told us they had found us a place in Skegness. This one has standard gas central heating. It's a detached bungalow, so no neighbours poking their noses over the fence. It's virtually cut off from all potential prying eyes by tall conifers or high fencing. It is offset in such a way that no other property looks directly in. It's less than a mile from the sea too.

I visited twice yesterday, once mid-afternoon and again mid-evening, a modified and very sensitive Degen DE1103 in my hand, just to test for noise. There was no noise at all on MW or band 2. I was surprised how clear the band was and what was getting through. Comparing this with reception on the garden back at home showed just how bad things are here. The Degen picked up plenty of noise which buried the stations i was receiving at the new property. I am surprised the FM5 does so well, but that is directional. I don't think anybody is exempt from noise these days. It's a ticking time bomb for us all.

No doubt there is plenty of potential for noise though as there are lots of other houses nearby, but none are adjoining and all are separated by footpaths so we are slightly further away from 'people'.

Thank you Nick and Dave.

I hope so. Looking forward to this and I hope the noise keeps well away.
It will be nice to say goodbye to the problems we have had here.

Cheers

John

Good luck John with the move you can put the past trouble behind you and a new start with good DX.

Hopefully you will be QRM free and no neighbour problems.

Andy

** Personal Skegness 'First'

I discovered a great little tool this morning (for people who can't handle basic arithmetic like me) by the name of Time Calculator.

http://www.calculator.net/time-calculator.html?tcday1=&tchour1=00&tcminute1=45&tcsecond1=&Op=%2B&tcday2=&tchour2=05&tcminute2=51&tcsecond2=&tcday3=&tchour3=&tcminute3=&tcsecond3=&x=55&y=10

After realising I had made a couple of errors with my time calculations I searched for something which did it for me - accurately! This is the problem I have found. When I begin my overnight recordings in WaveLab, I name the file according to the date and the start time of that particular recording. All meteor bursts are clearly visible along the timeline, which has hours and minutes marked along it. You can in fact change the start time in WaveLab to something meaningful, thus producing the actual correct time along the timeline, but this has never worked for me. So "00:00" might correspond to a correct time of 01:45" and therefore "02:15" will correspond to "04:00", as examples. The problem

is, as I quickly discovered this morning, that my calculations were going wrong and I was out by an hour, etc. If I had two brains cells I might be better at this (or dangerous, as they say), but this little web calculator does the calculations for you. You enter the actual start time of the recording and then you enter the hours and minutes given on the timeline which correspond to a meteor burst. I think I will be using this regularly now.

Two days to the house move! The 9.2 antenna should be coming down today providing the weather stays calm. I might be out of action for a short while, but I will try to do what I did when we moved here and put up an FM3 on day one and try a quick bandscan, time permitting (Jane insists!)

Good DX!

On these blogs I posted some videos and images about new Elad receiver FDM-S2 operated with new software FDM-SW2. It seems to work well also on FM with RDS decoder.

This video is also worth a look

http://www.youtube.com/watch?v=0t0dwKTBGtU
<http://www.youtube.com/watch?v=0t0dwKTBGtU&feature=youtu.be> &feature=youtu.be

Think the video was only supposed to be 9 mins long as it goes black after that.

An interesting piece of kit indeed, and the software looks better than that for the Perseus FM+, for example.

Apparently has a dynamic range of 110dB, so much less susceptible to images, hopefully. I saw another video of a very strong signal (-20dbm) on 104.4 and no images.

Tempting……

30742. RE: Fitting the radio hobby in with the rest of your life

Yahoo group: SkywavesDX (2014)
Date: 2014-02-08 13:13:48 UTC
From: <tim.bucknall@...>
Topic: 30721 Message: 30742

Hi Paul,
interesting topic, after reading JF's message i have a feeling our answers will be fairly similar

- Do you set aside a specific time / day regularly for your radio hobby?

no, sadly the hobby doesn't really allow anything as sensible as this unless one is reviewing SDR files- i don't do this any more as i got sick of being on the computer

-Do you generally try and fit your radio hobby around the rest of your life or your life around your radio hobby?

I fit my hobby around my life, unless some astonishing opening is happening
(but until recently i had hardly any non radio life to speak of and time hung heavy),
i've been known to choose holidays around the dx possibilities of certain locations, and sometimes i get it horribly wrong - like Porto Santo
I've got quite good at squeezing dx opportunities out of any trip i make. when i go to London to meet Gulag survivors or attend some other event I take an ultralite rx with me, and if theres a quiet moment i log all the pirates, if not, then i listen on the train each way. You can bet i'll be making a thorough bandscan when i attend a conference in Warsaw in sept
We have to shop out of town now that congleton is being turned into a dormitory town, if we shop at Buxton or Leek we can often combine it with hilltopping

- How supportive are your family, friends and co-workers with your radio hobby and is it something that is seen as a part of your family life or is it something that is more hidden away and not really supported / understood by them?

Mum & Dad very supportive (i had to move back home for health reasons)

- Would you ever consider making a major decision due to how other people feel about your hobby such as ending a long-term relationship if the other person didn’t support your hobby and didn’t want you to participate in it?

no

- Any general tips or advice on the ways you combine your radio hobby with the rest of your life?

don't waste your energy trying to dx when theres no condx, it'll only turn you sour on the whole hobby.
IMO: keep re-logs to a minimum, to keep it fresh

prioritise your favourite reception, If a guest turns up during an E's opening but its only Spain/Algeria.
and you've heard it all before turn off the tuner and go talk to to them.

If it lifts the spirits then it can only be a good thing. I have always done things like this to artist and band names. I think I got it from a certain Mr Bucknall ;O)

I am a fan of the Canonical List Of Weird Band Names and have a taste for 'unusual' music, hating most things 'conventional'. Maybe it's just an age thing because I don't like much modern pop music these days. or maybe I am just being puerile.

I do find it quite interesting, psychologically, that if I hear some cheesy pop song over and over again on a continental station, I actually get to like it. Katy Perry's "Roar" is an example of this. I would usually hate this kind of stuff. It's the association of music with with DX. If FM4 in Austria played the Crazy Frog, I'd probably like it!

:O/

Very tempting - imagine recording 6MHz of FM BW in a major SpE opening for a few minutes straddling the hour and then going back and collecting all the ids and program announcements - if RDS wasn't received.

** Personal Skegness 'First'

Thank you Tim Bucknall in Congleton for suggesting 102.5 for an
overnight meteor session. This was a VERY productive frequency. To
emphasize this, I logged all stations identified next their web streams
(I recorded 17 overnight). Again, it's a little repetitive, but
hopefully it paints a clear picture of what's happening. Tim was curious
to learn if I would receive Kaliningrad and I am very pleased to report
that I did indeed receive this rare 'country'. Bruce Springsteen's "High
Hopes" appeared at 0540 and I was able to confirm that this was exactly
the same as the Radio Mayak web stream which I recorded throughout the
entire night. Ten hours of each stream were recorded in total. That's
170 hours of audio. I decided to have one last big blow out before
tomorrow's move. Just about everything is packed and ready to go.

All this was possible, despite the garden FM5 receiving some noise over
the last 24 hours, more so than it has done previously. Things are
really getting bad here. I just hope the move to the new property proves
to be far less noisy. At least I will have a greater choice of places to
mount the 9.2.

Good DX!

John Faulkner, Skegness, Lincolnshire (JO03dd) <2m ASL.

Band 2 Aircraft Scatter:
91.7 0739 BEL VRT Radio 1, Sint-Pieters-Leeuw/Norkring Toren (vlg-vbr) Pops, as web 376km
93.8 0740 D bremen eins, Bremen-Walle (bre) Rock track, as web 565km
89.6 0747 BEL VBRO, Brugge/Walakker (vlg-wvl) OM, as web 295km
90.5 0753 BEL RTBF Vivacit?, Li?ge/Bol d'Air (wal-lge) French OM ads, as web 459km
90.8 0754 BEL RTBF Classic 21, Profondeville-Rivi?re/Sart ? Soile (wal-nam) Queens Save Me song, as web 441km
93.5 0757 D WDR 2, Nordhelle (nrw) Ad break, as web 554km
96.1 0759 BEL RTBF La Premi?re, Wavre (wal-bra) IDs in promo 397km
97.5 0759 BEL VRT Radio 2, Schoten (vlg-ant) Good Morning, Radio 2, Jingle ID and YL news 354km
103.8 0809 D WDR 4, Nordhelle (nrw) YL ID 554km

Well, that's it. DXing officially concludes at this address. One final scan across the band before unplugging the FM5.

The 9.2 comes down today. This wasn't possible over the weekend due to high winds.

I'll be offline for two weeks before Sky broadband is installed at the new address so I'll probably use wi-fi from one of the local coffee shops. It's a pity this couldn't have been arranged with more notice but we had no official confirmation that were moving until last Friday. We have a two week window in which to vacate the old address, which gives us thirteen days more than last time!

See you soon!

Good DX!

John:

In reference to heat pump A/C. When I live down Florida
we had this type of unit running on 240 A.C. mains. I never
had an issue with RF interference in over ten years since we
resided there. You might possibly only hear the relay(s)

being energized to run the compressor motor.

Regards,
Mike Schaffer

On Wednesday, February 5, 2014 6:40 AM, "John Faulkner, Skegness" <john.faulkner@...>
wrote:

As I have mentioned the other day, we should be moving house shortly.
Two questions are burning in my mind, the first of which is important to
the hobby concerning potential interference.

We are looking at potential properties which use a form of heating
called "Air Source Heating". I have never heard of this and have done
some research. It seems to be a kind of air conditioning which involves
a pump. There is a Wiki which explains a few things.

http://en.wikipedia.org/wiki/Air_source_heat_pumps

I was wondering about the likelihood of this kind of heating being an
interference source. Does anybody have any experience or knowledge?

The second question is a small point regarding starting new logbooks
from scratch. When we moved from Nottinghamshire to the east coast I
started new accounts in FM List and created new personal logbooks. With
reception being so different here it seemed like a good idea to begin a
new logbook and separate the old loggings from the new. Another
consideration was moving into a new ham radio locator, or "square". This
is more relevant to amateur radio as this will make a big difference to
a ham radio logging. But what about broad cast DX?

Doing this by the book, I probably ought to start a new logbook if we
move to a new square, even if within Skegness as there are six in the
immediate central area. If we moved outside Skegness, let's say closer
to Boston to the south or Cleethorpes in the north, should I begin from
scratch again? I am inclined to think that I should. But what would you
do? Is there a right and a wrong way to do this, 'officially'?

Please let me know your opinions.

Thanks

John

30757. Narrow Filters For Kenwood KT 6040

Plenty to try for there Tim. How do they ID? Morse? from which of those columns?
Did you hear the BBC R4 news yesterday at 6pm? for a few seconds before the TS Eddie Mair's 'random sound recording' was a clip of a fishing drift net beacon from the S Atlantic, but they faded it as the morse ID started, something like 'NI' iirc and of course they did not mention the qrg

Just bought some off eBay coming to over £50. One pack of 8 110KHZ and two packs of 3 82khz. A lot more expensive than I imagined but when I get them fitted I am fairly certain I will have an exceptional Dx machine.

Thank you Francis,
I can confirm that buoy 62126 in the Irish Sea is 34.5125mhz

I'll find someone on the East Coast of the UK to make perseus
recordings of the 27-37mhz range... when he's recovered from moving
house ;-)

With gust of 60 mph predicted for the early hours of Saturday I've just, with the help of the missus, dropped the garden aerial mast back into the horizontal position to avoid damage. This is the second time I've had to do this - but better safe than sorry. As the aerial support consists of a 10 foot scaffold pole cemented in the ground to which a 12 foot pole is attached by means of universal clamps designed to allow the 12 foot mast to be tilted/raised it's a simple job to unbolt a top clamp , loosen a bottom one slightly and swivel the whole lot into horizontal position - takes about 5 minutes. I hope everyone else's aerials are surviving the unprecedented winter battering - so far in this bit of the South East I've avoided the worst of the weather. The lawn is absolutely saturated and puddles take ages to drain away.

30783. House Move Update

Yahoo group: SkywavesDX (2014)
Date: 2014-02-14 13:45:33 UTC
From: <john.faulkner@...>
Topic: 30783 Message: 30783

A quick hello from the Storehouse Church in Skegness (they have free wi-fi) and an update on the house move.

Things are progressing steadily so far. We are doing the whole house move ourselves using the car. We will get the larger items moved tomorrow, courtesy of a local Man With A Van.

Reception wise: I have a temporary Triax FM5 on the garden, about a metre above the ground, right below where I plan to mount the 9.2. It is with great relief that I can report (so far) an ultra-quiet band 2. Continental reception is practically outstanding. I have been able to conduct a few listening sessions at various times of the day and have found continental reception to be vatiable, as you would expect, ranging from nil to RDS from the regular continentals. Aircraft scatter is much better than at the old address. Perhaps this has something to do with the fact that we are closer to the sea front.

I have been keeping a diary of conditions, which I will paste in below. There are some simple DX notes which I hope to transfer to FM List in due course, Hopefully it makes sense as I am not going to check through it all now - I am struggling to focus on this as I have left my reading glasses at home.

I have also pasted a short article in to my blog which gives an account of the near-disaster which was the removal of my 9.2 antenna and rotator. I don't think I will ever trust a high street aerial contractor with my aerials ever again!

http://skegnessdx.blogspot.co.uk/2014/02/a-word-of-warning-about-aerial.html
http://skegnessdx.blogspot.co.uk/2014/02/a-word-of-warning-about-aerial.html

Looking forward to getting the internet connected next week. The TV was connected yesterday and the phone will be connected in another week too.

Cheers

John

10-02-14
Monday was a busy day. We signed for the new property and got the keys. Then the rest of the day was spent ferrying box after box from the old property to the new one via car. These were just the smaller items. Larger, heavier items such as beds, wardrobes, white goods and so on would follow later in the week via a "Man we know With A Van".

The FM5 was mounted about a metre above the ground by 23:30, later than I was hoping. But it was time to learn how this new place would shape up as far as band 2 DXing was concerned. Would it be noisy? Would reception be the same as at the last address? In view of the noise problems at the previous address, it was going to be extremely nerve-racking switching on the XDR.

What a relief! The band was quiet, apart from a small amount of noise from the computer, which could be removed completely by placing the FM5 further away from the property. There is only a brick wall separating the FM5 and my computer equipment. I will keep it there for now as it is well hidden from anybody, between the wall and some tall conifers, actually touching both. I didn't hear a single continental station, however, which was slightly worrying. Maybe the FM5 was in the wrong place. I was too tired to bother moving it around and so decided to leave things until the morning. Semi-local English stations were about the same strength. Norfolk was actually slightly better, which could be a good sign. Meteor scatter seemed quite lively too at this point, so there was probably nothing to worry about. Perhaps sunrise would see an improvement. Despite this, it was a very pleasing start, despite the lack of continental stations.

11-02-14
I left Bandicam recording the XDR-GTK's display overnight, slecting 87.7 MHz, a reliable old favourite. When I checked things at sunrise I was pleased to see a partial RDS from Strasbourg via MS and full RDS from Lelystad via aircraft scatter! Strasbourg peaked at 26dB when I checked the Bandicam timeline, but the real achievement was watching Lelystad give full RDS at only 16dB! Thus indicating what an exceptionally quiet FM band it had been overnight.

Still very apprehensive, I began live listening shortly before 07:30. Lots of continental scatter was present across the band. As for noise levels ... what noise? This is good news as the FM5 is right below where I would like to have the 9.2 situated.

Listening again just before midnight showed a degree of continental enhancement so I turned off the computer to eliminate the interference and heard many continental stations. I was too tired to spend time compiling a log and so went to bed. German transmitters as far as Bremen were present.

Just before retiring, I had noticed a problem with the F1HD. When powering it up, it appeared to be initialising, flashing the usual "wait" message, but that's as far as it got. It struggled to switch on for several minutes. Eventually I restarted the computer and ran the GTK software, which brought it back to life. Since moving to the new address I have noticed that I have to leave the F1HD on for well over a minute before the GTK software can grab hold of it. It used to take about 15 to 20 seconds. Turning off the GTK software and the computer while the F1HD is switched on also works. I hope this isn't the beginning of the end of the F1HD.

12-02-14
It's another cold and frosty morning but it's quite bright and cheerful with it. Watch some Atlantic storm system come along and spoil it, blowing down our garden fence panels.

I discovered today that I couldn't switch on the F1HD unless I had the computer running. My understanding was that the GTK software didn't need to be active for this and that the F1HD would run in standalone mode. Perhaps I am wrong. As it is, the Seeeduino board is physically connected at all times as I haven't yet organised a plug and socket system so I can detatch them. Currently, attempting to switch on the F1HD without the computer leaves

it constantly flashing the "WAITING" message. Turning on the computer solves the problem. Maybe this is something I have never tried to do before as the computer was running all the time at the old address so I never tried to run the F1HD by itself.

I spotted an annoying little thing on the band this evening. Somebody was playing a computer game on 88.1. Well, I *think* it was 88.1. The signal was weak at 20dB, but it spread from 87.5 to 90 MHz. Checking below band 2 I observed almost constant images down below the OIRT band. It was very weak and only lasted for about 15 minutes.

One thing is for certain today is that other jobs have taken precedence, as they will for the next day or two, so listening time may be limited to early mornings. I have a telescopic mast to put on the garden to raise the FM5 to the height and location where I would like the 9.2. I was hoping to get this up yesterday evening but it will have to wait.

97.6 Decibel 0836
95.2 Slam FM
91.8 NOS2 - clear 0837
92.2 Omroep Thingy
93.0 Pop (F?) 0838
93.5 D // 992
99.8 NDR2 0839
105.7 Antenna Niedersachsen
88.4 Slam FM 0840
101.1 RTBF 0731

13-02-14
Another clear and sunny start to the day, plus a lie in until 8:30. I turned on the F1HD at this time to hear no continentals. UK stuff was also well down. Meteor scatter was still lively. More listening later perhaps. Ah .... I switched off the computer, leaving the F1HD on and the band sprung to life with dozens of weak continentals. So even the computer's piddling 6dB of noise is capable of masking very weak signals. At least it's not 30dB. Must get that FM5 up higher asap.

Finally, I had left the radio on 88.3 \round midday while I fitted a carpet in the hallway. I heard a strong signal suddenly appear with pop music. The fades were quickly and I assumed must have been sporadic E. I tuned around the bottom of the band to hear several more noise free stations. Before long I realised this wasn't sporadic E at all, but aircraft scatter from the usual continental suspects. If this is a taste of things to come then I can't wait to get the 9.2 up on the mast. During the rest of daylight hours I heard a few more repeats of this strong aircraft scatter. Reception was chiefly from Belgium and Holland, but with a small number of the more regular German transmitters.

Hi, I think aerial contractors must be part feline (i.e. nine lives) - the one who did my installation of an FM5 + Moxon + FM3 on a 16ft pole - carried it all assembled up the ladder! Me - in the days of long ago - when I installed a quad of Triax BB UHF aerials - fitted it to the mast at minimum height in the TK brackets and then raised it up bit by bit - and did the same when it eventually came down again.

Glad the move is going well. As far computer generated noise is concerned - are you using clamp on ferrite chokes on every lead - mains, PSU, USB etc - even the aerial cable. It all makes a big difference.

We've hardly had any let up in strong winds on the east coast, but we haven't suffered the devastation some parts of the south and west have had. Many places have had hurricane force winds. I can only guess our highest gusts - probably no higher than 50 mph. It has been difficult to stand upright at times, which IIRC corresponds to a gale at 45 mph average speed.

The worst we have had this week was the garden fence blowing down at the new property. This was Wednesday afternoon. This time there were no trees down locally, as far as I know, but it made for hazardous driving through town with tree branches and debris everywhere.

I would love to know if there is a reliable site which records local wind speeds here. I only know, Skegness Weather, which said we had "F1 Light Air" during the most severe winds I have known here just before Christmas.

John

Hi John,

Have you looked at http://www.skegnessweather.info/ http://www.skegnessweather.info/ which is someone's personal weather station. I use the weather station at DSSmith Kemsley Paper Mill (where I used to work). The problem is personal weather stations are not likely to be well sited for the wind speed sensor - which needs to be high and in the clear without interference from nearby buildings.

I use the Met Office 5 day forecast as an early warning.

It's good to know the move is going ok and more important lol that reception is also ok.

I can't believe those so called aerial installers and the way they took down your aerial as it's not rocket science as just looking at the aerial/rotator it should have been obvious how it all comes apart.

Maybe the thought of undoing 10 bolts on the aerial/rotator and 6 on the mast was too much and disconnecting the cables.

That is not the way to take an aerial of that weight down as one slip and a broken aerial.

Anyway good luck with the rest of the move and hopefully some tropo at the end of the month.

Andy

John,

When you erect the 9.2 on your new qth place the rotor behind the reflector if you can because it will have negative effect in vertical position mounted as you had it before.

Hi John, Strange things happening with the posts to yahoo group - I couldn't see my post either for quite a while.
Sittingbourne is also in an 'anomalous' area as we are protected by the North Downs and the Blean Hills (Canterbury) which makes a nice sheltered enclave from the prevailing westerlies - but woe betide if the weather comes from the east!

I will try to do this Sven. Wouldn't I need a counter-balance though? I wonder about the strain this would put on the G-5500 rotator with all the weight on one side. I have to go through the planning permission routine again. It is a different landlord this time as the last one was taken over. Our nearest office is in Solihull, about 150 miles away. I have already been informed that permission should be straight forward this time, and much quicker. Thanks John

John,

Yes try to have a counter-balance and put some weight on the counter side so the rotor won’t be damaged.

Get a good balance.

I moved the FM5 slightly today in an attempt to put it in free space, rather than where it was, sandwiched between a brick wall and some tall conifers. In doing so I lost all continental reception while gaining signal strengths from inland. I left the FM5 in its new position for a few hours so I knew this wasn't down to conditions. No continentals returned. Then I moved the FM5 somewhere else. Still nothing from the continent. On returning the FM5 back to its original position all the continentals returned. What a difference a few feet can make. I had been demonstrating some of this to a friend who was quite intrigued. He wants to set up an FM listening station in his second floor flat which is about 100 metres from the sea front. I will give him a Blaupunkt (Digiceiver) car radio and an FM3 to play with. Cheers John

To All:

I am not seeing any European aurora reports on the DXMaps website this evening (my local time).

Looks like everyone across the Atlantic is napping during a geo-magnetic K-index (G1) storm. Threshold was reached at 2359 UTC, February 16.

6 meter Au was reported during 0032 UTCacross the central Great Lakes along the US/Canada border region.

Thanks Tim. Interesting that and it reminds me that I did a bandscan in autumn last year in Esher in Surrey which I never posted. Here are the results:

87.9 Shine 879
88.4 Vision Radio
88.6 blank carrier
89.6 Westside Radio (community st)

90.0 reggae/rnb
90.2 Point Blank FN
90.4 modulation on/off

90.6 Freek FM (blank carrier)
90.8 ads
91.8 Hayes FM (community st)
92.0 house music
92.1 OM talk (very weak)
92.2 Scream London
92.6 old school hip hop
93.7 Vibes FM
94.0 religious px
94.4 reggae
94.6 Kool FM
95.1 Origin FM
95.5 On Top FM
96.1 S-Dance
99.3 Select UK
99.5 reggae (weak)
99.7 garage
100.3 House FM
101.2 Unique FM
101.5 house
101.7 Flight FM
101.8 Turkish? pirate
101.9 reggae/rnb
102.0 roots reggae
102.5 Galaxy
103.6 house remix of Robin Thicke

103.7 Kane FM (community st)
104.3 Logic FM
104.7 ads in Turkish?
106.0 West African music, poor audio
106.5 house/garage
106.8 Rinse FM (community st)

107.3 Time
107.4 Kick It

One or two close to London legals there e.g. 102.0 and Logic FM 100 kHz away from Resonance!

Good DX.

Nick, Whitchurch, Hampshire.

Yamaha T-2, Denon TU-800L, Kenwood KT-1100SD (modified), Yamaha T-85, Sony XDR-F1HD tuners, Triax FM5 horizontal beaming east.

That's a lot of pirates and I complain when there's any here lol.

Mixology 101.4 is only on weekends and I suspect they are using Blitz FM's RDS MAX 4000+encoder as Blitz was using this and now Mixolgy is using that type of encoder.

Blitz FM 100.7 has not been on for a long while now so I think they have sold up.

Attachments: 1 described; binary payloads are missing from this source WARC

Just checked out the Hearts I can receive here. All have the PS:
Heart___ (in sentence case). Sorry, can't check the PI codes.

They are:

97.0 Reading - Fountain House/Broad Street Mall
102.6 Oxford
102.9 Hannington
103.4 Henley-on-Thames
106.2 London - Croydon

All but the last make up the Thames Valley region of Heart.

95.8 Capital has the PS: Capital_ (in sentence case). This used to be in
capitals (literally), but I can't say when I noticed it change.

From: Ian Kelly
Topic: 30815 Message: 30821

While I think of it, 107.0 Reading 107 will shortly be rebranding as Jack FM Berkshire. PS name at the current time is still: READING_

106.6 Time FM in Slough has an uncertain future. For two weeks, it has been playing back to back music only - no presentation, no news, no ads. This follows the previous owner going into administration. The new owners haven't quite got their act together - apparently they were kicked out of their old studios in Southall. I wouldn't be surprised if the current output is playing off someone's laptop! For a few days, Incognito's ironically titled "Don't You Worry Bout A Thing" was on rotation about 6 times an hour, but that has stopped now.

Quite disturbing that the new owners couldn't lash together some local news or traffic somehow - in the two weeks that villages such as Wraysbury and Datchet, smack bang in their coverage area, suffered devastating flooding, and the main railway line from the West Country into Paddington flooded near Maidenhead, again in their coverage area. The flooding was probably the biggest news story to hit East Berkshire in many years.

In contrast, the community station up the road in Marlow, Marlow FM, managed to carry on, despite their normal studios being flooded!

30823. HDSDR & RDS Spy

Yahoo group: SkywavesDX (2014)
Date: 2014-02-18 19:48:58 UTC
From: Andy Pritchard
Topic: 30823 Message: 30823

Hi All

After some head scratching I have finally gotten RDS Spy to work with HDSDR and the early results are impressive.

So I thought I would share this how-to with the group:

1) Download Virtual Audio Cable Software
2) Download HDSDR Software

In VAC Control Panel

1) Set Cables to 2
2) Set Cable Params -> SR to 192000 in both drop downs

In Windows Manage Audio Devices

1) Line 1 (Virtual Audio Cable) set to 192000 sample rate in advanced settings
1) Line 2 (Virtual Audio Cable) set to 192000 sample rate in advanced settings

In HDSDR

1) Pick a FM .wav file (or live FM)
2) Select FM
3) Set Soundcard RX Output to Line 1 (Virtual Audio Cable)
4) Set Bandwidth to 192000 on input and output

In VAC Audio Repeater KS (Kernel Streaming)

1) Wave In: Line 1 (Virtual Audio Cable)
2) Wave Out: Line 2 (Virtual Audio Cable)
3) Sample Rate 192000

In VAC Audio Repeater MME (if you want to hear the station audio)

1) Wave In: Line 2 (Virtual Audio Cable)
2) Microsoft Sound Mapper
3) Sample Rate 192000

In RDS Spy

1) Input Audio Device: Line 2 (Virtual Audio Cable)
2) Set Input Mode: Direct RDS/MPX

This wires up it up like:

HDSDR -> VAC1 -> VAC2
VAC2 -> RDS Spy
VAC2 -> Speaker

I can't get it to work without the 2 VAC's

Enjoy!

Andy, excellent guide!

You can "avoid" the second VAC by using a piece of software called "Audio Repeater" (which is part of VAC, IIRC), or, using a second instance of HDSDR!
I've been usign the first alternative last summer, and was shown the second by a friend.

From: Andy Pritchard
Topic: 30823 Message: 30825

Thanks G?nter

I don't know why but I need 1 VAC for playback [output] (VAC1) and another VAC for recording [input] (VAC2) without this setup I either get an error in HDSDR and/or the VAC is not listed in RDS Spy.

Andy.

30826. Re: [SkywavesDX] New Elad SDR receiver FDM S2 in action

Yahoo group: SkywavesDX (2014)
Date: 2014-02-19 11:04:20 UTC
From: <fm104rockinstereo@...>
Topic: 30740 Message: 30826

After translating part one of the Reflexion review of the (predecessor?) FDM-S1/PDC-F1 combination in Reflexion, this seems very favourable. Sensitivity specifications don't compare favourably to the Sony XDR-F1HD as measured by Tim McVey (using 10dB SINAD) but that's to be expected.

The price is just under $900 Australian dollars when shipped here from Germany. That's a lot of dough, but I'm seriously thinking about ordering provided it frees up some time... Fortunately, it is still out of stock so I have some time to think carefully!

Information on stock and availability in different markets is available here:
https://groups.yahoo.com/neo/groups/elad_sdr_en/conversations/topics

I have never received any Transatlantic Dx on VHF. Is it usually more a summer phenomenon and what is the propagation mode? You say you will listen again at sunset. Is this always the best time. I do some MW dx during the winter but have never thought about this. Cheers Alex

At this time of year and with the current solar activity, it will be F2.

I worked North America on 50Mhz in Februaries of 1989-92 when solar activity was a good bit higher.

Jim.

From: Chris Thatcher
Topic: 30807 Message: 30829

Hi Alex,

VHF (Band II) Transatlantic DX is usually due to multi-hop Sporadic E, during the summer.

MW Transatlantic DX is best during winter time low sunspot periods. (We are at solar max now, not that it's very high).
The so-called MUF (Maximum Usable Frequency) should be at its highest about now. This causes Aurora Borealis to be seen further south than usual. It is also allowing frequencies as high as around 39MHz to be received in the UK (when the midday sun is at mid-hop position). For USA this means around 15:00 GMT.

Cheers,

Chris 2E0NDT

30830. RE: Californian Opening on 39 mhz - Feb 15th 2014

Yahoo group: SkywavesDX (2014)
Date: 2014-02-19 18:40:07 UTC
From: Chris Thatcher
Topic: 30807 Message: 30830

I should have also added that the MUF is related to F2 reception. The amount of sunspot activity has nothing to do with Sporadic E.

Best regards,

Chris.

30838. Smooth Radio - No RadioText

Yahoo group: SkywavesDX (2014)
Date: 2014-02-20 08:29:40 UTC
From: <chris.thatcher123@...>
Topic: 30838 Message: 30838

Here in Lincoln, UK, I receive Smooth Radio from Waltham TX on 106.6MHz. Since last Thursday there appears to be no RadioText. RDS is as normal, showing "Smooth", but info about what tune is playing, is no longer being transmitted on 106.6MHz FM. Smooth's DAB TX at Waltham is transmitting Text, as before.

If you can receive Smooth Radio on FM from other UK TX sites, can you please check if RadioText is still being transmitted.

I have emailed Smooth Radio about this, but have so far, received no response from them.

Many thanks,

Chris 2E0NDT

Some are more timid than others. The locals are used to them and only take notice when they are fighting or stealing! As the monkeys are thieves, they are not allowed in rooms -there is a warning to close windows etc. Credit cards aren't needed in the sort of cheap hotels I stay in, cash in advance! :)

** Personal Skegness 'First'

We are now (just about) settled at the new address. I am currently using
a temporary Triax FM5 at rooftop height. Hopefully the 9.2 will be on a
scaffolding pole above the rooftop very soon. Being only a few hundred
yards from my old QTH I was pleased to discover that my grid square
remains the same, so no need to start new logbooks. .

Good to hear Brocken on band 2 again. So far this has been daily on
scatter. Pretty good going for the time of year. I think I can also hear
Inselberg on 97.2, but it's way down in the FM mush. Good to hear
Bungsberg again too.

Meteor scatter is still been very good for the time of year but my
overnight session was cut short this morning when my internet connection
mysteriously dropped and I lost all the streams after a couple of hours.

Good DX!

John Faulkner, Skegness, Lincolnshire (JO03dd) <2m ASL.

You're welcome Günter,
There is "Part 0" already. "Part 1" should have been Part 2!
The ETM scan on my PL-606 yielded over 40 stations, and it missed the stations ending in 0.05MHz. Several stations play non-stop music. I'll try and catch IDs from some more stations. The three different OK Luktung stations are a bit of a mystery.

Band 2 Meteor Scatter:
88.4 0147 F France Culture, Bar-le-Duc/Willeroncourt (55) String quartet, as web 607km
88.4 0441 D MDR Figaro, Leipzig Wiederau (sac) Classical music, as web. Not in // with Bayern 2 at this time 843km
88.4 0641 D Bayern 2, Pfaffenberg (bay) OM financial news, as web 712km

Since my stream recordings were curtailed on the 20th, all at the same time, I thought I would do 88.4 again. The same thing happened again, at the same time. Hmmph! Maybe it's just Sky running broadband tests on this new connection - *if* that's what they really do. That's what they told me on the phone anyway. As luck would have it, only the same stations were logged as on the previous morning.

I managed very little listening during the daytime. Hopefully some more radio time soon.

Good DX!

Hi all,
still typing up the London Bandscan, but wow!
In London DAB really does mean more choice, if it were like that
outside London i wouldn't be nearly so harsh on it!

I had no idea London had an extra TV channel: Bonanzabonanza which
showed reruns of I love lucy- a local tv stn is also on test see
photo

these 2 channels were on a MUX on 538mhz.

The FM Band was brilliant! like being abroad in that the BBC/classic
fm /SFN bands were broken up by pirates and CR's thus never
predictable like they are back home

I have many many unids that still need IDs but something i noticed
with regret is that the opportunities for dxing London pirates in the
North Midlands are much reduced now

Ofcom have cleared the 87.5-87.9 range which was my main "window" on London.
nothing was heard on 108 either

nothing was heard on 91.6 or 89.4 - previously 2 of my favourite
channels for London pirates

old stalwart Vibes FM has moved down from 93.8 to 93.7 so no chance
of hearing that in the north now

so whats left to try for? well Unique 101.2 is on a great frequency
and is in North London - they also play fantastic dubs!

90.6 & 90.4 are also good candidates for dxing in the midlands

anyway the unids:

87.9 Wednesday night only -weak dance
88.2 Weak Drum & Bass
89.8 carrier on jet scatter
90.0 Ghanaian unid
90.4 R&B
90.6 dance mx w/ intermittent tx fault causing drops in signal 20/2
2054ut no tlk
90.6 Dance mx, North London, fault fixed or new stn? some tlk but no id 22/2
92.2 Jamaican mx
94.2 Slow Jamz, North London
94.4 a 2nd Reggae pirate mixing with Flames FM - one of the 2 stns
relayed Jamaican radio nx

96.4 Sermon in African language
97.1 Rave mx except Wednesdsay
97.8 non descript dance mx
97.9 continuous Trance
98.1 non descript dance mx
101.3 Dancehall mx
101.8 Turkish
101.9 Reggae
102.8 Turkish
104.0 Reggae
104.2 Turkish
104.7 Turkish
105.2 partial ID "HOT..... dot com" mostly slow jamz
106.5 carrier- weekdays only

a couple of STLs presumably the BBC, were hrd on the tecsun:

67.83 "Studio A, Ident1"
86.82 "Studio A, Ident1"

Yes, national Services still relayed locally despite as you said, the de-facto independence of Western Ukraine.
according to our contact Lyudmila at Lviv council: "no need for seperate services, Journalists tell the truth mostly"

A very interesting list Tim. Have you tried Martin Payne's London pirate list on his Transmission Zero website?

http://www.transmissionzero.co.uk/radio/london-pirate-radio/

From there I'd say some of your UNIDs are:

87.9 Shine 879
88.2 Rude FM

89.8 Station FM
90.0 Hot 90
90.4 Whoa FM
90.6 Freek FM Live

92.2 MetroLoveRadio
94.4 Street FM
96.4 Surprise Radio
97.1 NRG Live
97.8 Bassline
97.9 Brighton pirate listed

98.1 perhaps Mystic Radio Live? (although format is listed as hip hop, reggae, rnb)
101.3 maybe Spice
101.8 Bizim FM
101.9 The Beat
102.8 Radyo Umut
104.0 Muzik Radio
104.2 Dem Radyo
104.7 Pozitif
105.2 Heart Of Love Radio
106.5 Project Radio

It's a very good site and seems to be kept up-to-date. I have certainly found it very useful in IDing pirates here when tropo condx to London are up.

Good DX.

Nick, Whitchurch, Hampshire.

Here in Lincoln, UK, I receive Smooth Radio from Waltham TX on 106.6MHz. Since last Thursday there appears to be no RadioText. RDS is as normal, showing "Smooth", but info about what tune is playing, is no longer being transmitted on 106.6MHz FM. Smooth's DAB TX at Waltham is transmitting Text, as before.

If you can receive Smooth Radio on FM from other UK TX sites, can you please check if RadioText is still being transmitted.

I have emailed Smooth Radio about this, but have so far, received no response from them.

Many thanks,

Chris 2E0NDT

From: John Faulkner, Skegness
Topic: 30873 Message: 30873

After a few busy days with not much radio time I am tuning around this morning to find zero continental activity. Everything checks out, i.e. aerial, no noise, locals are at usual strength. Clearly there is some kind of a 'conditions blanket' preventing aircraft scatter. Once again I find this really interesting. Conditions were similar, though not quite as poor, yesterday too, but you would expect aircraft scatter to continue, yet it doesn't.

The weather, locally, is dry, about 7C, and with a fair amount of blue sky. We are expecting highs of 10C today. More cloud is currently visible out to sea. We had sharp showers late yesterday evening.

I recorded 87.5 overnight for meteor scatter and I will check that in a few minutes.

Good DX!

John

The cloud over the sea has lifted and Dutch scatter has returned with a vengeance. Was it really the low cloud which was blocking the signals?

Meteor scatter was almost non-existent overnight too, but I hear much more as I type.

Good DX!

John,

Low cloud was probably the evidence that the asmoshere was not conducive to allowing signals to travel, rather than the clouds themselves blocking the signals?

** Personal Skegness 'First'

Frequent meteor scatter overnight. 19 streams recorded. Clearly CRo Vltava and 88.6 Der Musiksender were the persistent stations. France Culture was also quite frequent. Lots of UNIDs too.

Tonight, the internet permitted me to record over two and half hours of streams overnight before cutting off! I must get on to Sky. Not had them a week and four complaints already: 1. Internet keeps dropping connection; 2. Our new ex-directory number is showing in CLI displays, and 3. Additional charges on the bill after being assured that there were no charges for moving (we have exactly the same setup). This is not good enough Sky!

I now realise that I need to fully configure a laptop for DXing and all DX related software as my main computer is still causing too much interference. I have added some additional ferrite rings on cables but this has not made a lot of difference.

Good DX!

30898. Aurora

Yahoo group: SkywavesDX (2014)
Date: 2014-02-27 22:44:12 UTC
From: nick gilly
Topic: 24790 Message: 30898

I just heard on the BBC weather that there is a visual aurora, with reports as far south as Essex. I just checked here but nothing seen. Is anyone else seeing it or hearing any auroral propagation on Band 2?

Good DX.

Nick, Whitchurch, Hampshire.

Yamaha T-2, Denon TU-800L, Kenwood KT-1100SD (modified), Yamaha T-85, Sony XDR-F1HD tuners, Triax FM5 horizontal beaming east.

I saw photos of the aurora on the BBC Yorkshire & Lincolnshire regional news bulletin at 22:30 this evening, as taken in Lincoln, but I never thought to check at the time. Looks like I missed it yet again. Didn't check the radio either.

:O(

** Personal Skegness 'First'

It was 96.1 tonight. Radio Romania Cultural from Oradea at 1677 km was
the most consistent MS station by a long way, featuring several times
each hour.

The internet dropped as per usual, this time around 0300. I spoke to Sky
about this and they explained that they are still conducting line tests
and will be doing so every night into early March so they can find the
optimum speed for this connection. Tests are usually conducted around
02:00 and I have been told that they do drop the line at this time.

Good DX!

Might have been a hint of a glow in the sky here but too much
streetlighting.

Left an SDR I/Q stream recording the bottom end of 2m for auroral signals
but surprisingly heard none. Unusually, looks to have been a much better
visual event than a radio one. Normally, 2m would be full of auroral CW
signals with a visual event so far south.

Jim.

** Personal Skegness 'First'

Meteor scatter was less prevalent overnight, but I was pleased to
receive a 960 watt Austrian in the form of 88.6 Der Musiksender from
Wiener Neustadt.

I raised the FM5 another metre today so it now clears the rooftop and
can see over the conifers. This has made an enormous difference. The
noise from the computer is much quieter too, plus I can hear some old
favourites which I haven't heard for a long time. The usual German
transmitters, such as Langenberg, Teutoburger Wald and Munster were
aomost at RDS level. Great to hear Brocken and Torfhaus back together
again.

Good DX!

I have been thinking more about this Jim. I think there really is a blocking effect. I have mentioned this before and completely forgot about it having not got my head 100% around radio matters due to the house move, decorating, etc.

It's more than just conditions. There has to be a blocking effect because there are still planes flying in the air. Chance are there would still be plenty of meteors coming through too. All DX of a scatter nature stops from time to time, hence me thinking there is a blocking effect from something. I have never seen an explanation for this.

Maybe it's something to do with the sea air. Moisture levels possibly. Consider fog too, also excess moisture. This can also block or enhance. Maybe the salt air plays a part. I can only guess.

The east coast in particular is notorious for its summer sea breezes, very welcome on a hot day. During the middle of summer, the sun heats the land while the sea is still relatively cool, so air is drawn in of the sea as the air over the land rises. The opposite happens in winter.

Cheers

John

Hi everyone I think the explanation may simply be "sub-refraction". With the tropo openings we are all familiar with - the refractive index of the atmosphere increases causing radio signals which wpuld head out into space to be bent toward the earth. However under certain conditions the refractive index of the atmosphere can decrease - i.e sub-refraction' and signals are bent away from the earth. If you Google "tropospheric propagation" and look at the 2nd image from the left in "Images for tropspheric propagation' that pops up there is a nice diagram.
There is also a short paragraph in the RSGB handbook talking about the boundary layer that can occur which forms ducts. It says that if that boundary layer gets closer to the earth stations on the hills will hear stations near sea level still working DX when for them the band has gone dead - and then says that if the boundary layer reaches the ground then there can be a complete drop out of signals.

So I would add my own interpretation - a boundary layer could cause M-S reflected signals to be refracted away from the earth - and if signals are being refracted away from the earth might not reach the aircarft flight paths that produce the scatter?

During the past winter I have noted on a number of occasions that signals have greatly improved for a short period as a weather front approaches - the pathe being enhanced parallel to the weather front.

BTW at this point in time RTL Luxembourg on 88.9 is making a fairly good showing with hr3 on 87.6 coming and going - plus a few short meteor bursts

I also received the New York repeater at full strength, very nice & clear reception. Plenty of other US & Russian comms on 11 & 10m & hams were also at good signal. Had some Italians & maybe Greeks too.
Also had a presumed Russian signal on 39470 kHz. Also I think I got something very weak on 33080, could hear something but very hard to tell. I will try & post a video later.

sleeper77, Southampton.

Thank you Dave.

In an excitable medium, wave breaks are essential for spiral wave formation. Although wave breaks can result from collisions between a wave and an obstacle, it is only when the resultant wave fragments separate from the "obstacle ~wave-front–obstacle separation" that a spiral wave will begin to develop. While I haven't a clue what that means it sounded very impressive but probably has nothing to do with the subject, but this Boundary Layer does indeed sound like a likely reason for my 'band collapses'.

I too have noticed, on many occasions, how conditions become enhanced as a front approaches, particularly from west to east, even when it still has a couple of hundred miles before it reaches me. The DX has gone before the front arrives or is directly overhead. After that, the band can only be described as "less than flat".

So the blocking effect could simply be the boundary layer refracting signals back up again before they reach the ground? No need to worry about an exact explanation.

It would be interesting to see the the boundary layer highlighted in some way in our tropo forecasts, or maybe even an approximate assessment of its effects.

John

Band 2 Meteor Scatter:
100.0 0005 D Hit Radio FFH, Dillenburg/Angelburg (hes) Pop song, as
web. Two second burst 614km **
100.0 0051 D Radio PSR, Chemnitz/Geyer (sac) Justin Timberlake song,
as web 904km **
100.0 0118 D Radio Sal?, Bliestal (saa) Tom Odell song, as web 650km **
100.0 0133 DNK Pop FM, K?benhavn-Gladsaxe/Isbanevej 4 (hvs) Buggles
song, as web 836km **
100.0 0900 D WDR 4, M?nster/Baumberg (nrw) YL news, mixing with its
own aircraft scatter 493km **

** Personal Skegness 'First' via meteor scatter

Hit Radio FFH and Radio Salue were the most frequent 'bursters' on 100.0
overnight, but Radio PSR was also quite frequent.

I made a shocking discovery when I calculated the total size of my
overnight downloads this morning .... 16GB!!! I had no idea it was that
much. Mind you, I recorded 25 streams for almost ten hours. It's a good
job that my Sky package offers truly 'unlimited' bandwidth, though I am
sure it doesn't work quite like that. I think I need to cut down a little.

Aircraft scatter was slightly down on yesterday but Brocken still got
through on 89.0. This was consistent throughout daylight hours but
remained very poor.

Good DX!

** Personal Skegness 'First' via the mode

A little tropo to the nearer parts of Germany today, also some enhanced signals from Holland.

I have now configured my laptop to run the XDR-GTK software, thus removing the noise from my desktop computer.

Unfortunately, noise has found me again. I have noticed some odd and persistent noise to the south. It varies in strength and produces a buzzing noise when at its weakest, then white noise when it increases in strength. The different states in strength last from 15 minutes, but can be longer. The increase/decrease is abrupt and registers 20dB at worst. All other directions remain noise free for now.

Good DX!

Hi John,

Could it just be a case of tropospheric enhancement, but in the opposite direction so that signals are bent up into space?

I notice that nearer transmitters can be heard via aircraft scatter when conditions are flat. When conditions are enhanced, further transmitters can also be heard via aircraft scatter. It seems to me that aircraft scatter has quite a dependency on general conditions. I don’t know about meteor scatter though, as I’ve never managed to pick anything up via MS.

Regards,

Martin

Thanks Martin.

Without understanding much of the technicalities around this, I can only guess. It could be some kind of reverse tropo - the layer which bounces signals back up - as is seen as echoes on weather imagery. Like you say, perhaps they can be one way sometimes.

This Boundary Layer thing could be an explanation too. Maybe they are similar things and interact. Fascinating subject though.

John

Hi Dave,
happy to hear your problem is sorted out. I'm sure you will be happy with the "new" radio.

There's nothing in the code that indicates anything about AM stereo, so I don't think it is supported. Unless the IDM module does it fully autonomically.

BR Arto

The sound is a bit messed up, but the people talking are still audible.

I would use DropBox for soundfiles in future, although I still prefer YT despite its flaws since I get more feedback from those who are not members of this group.

Hi Phill,

So-called "Quad" dipoles work very well in confined spaces. If you look back at earlier posts in this forum, someone has made one for use in his London home. Sorry, I can't remember the title of his messages. It was about 2 months ago.

Cheers and good luck,

Chris (2E0NDT)

How limited is 'limited' - And where are you located?

If you are allowed to put an aerial in the garden then a 3 element or 5 element mounted 5m above ground would give you good results for summer Sporadic E reception. You can buy an aerial rotator for under £60 which will easily handle this sort of aerial - providing you don't use a stub mast on the rotator longer than 3 feet.
If you have low electrical noise then you should also do well on M-S (see John Faulkner's postings for example).If you have a good 'take-off' to the continent then you can expect to get weak signals up to 450 km regularly on tropo scatter. I have a clear path to the continent - and regularly (75% of time) get the near German stations in the range 400-500km even when the nearer Dutch and Flemish stations are poor.
The only 'problem' is that Dutch and Flemish speaking Belgian stations use vertical polarisation - in theory you won't pick them up but in practice tropo scatter /aircraft scatter can mess up the polarisation and in poor conditions I've found reception as good on a horizontal aerial - 'as good' meaning for a weak fading signal.

Have a look at the photos and files section - pictures of various aerials are there.
Depending on the design of the bungalow you could fit an aerial in the loft - which is how I started - but reception is much better outside - away from electrical interference.

Hope this gives you some ideas.

Rgds

David

From: <davebunyan@...>
Topic: 30980 Message: 30980

Hi everyone,
For the first time in quite a few days I'm getting RDS level signals from Lille and Egem - tropo forecast and Met Office forecasts look promising although it's likely the tropo lift predicted for the week-end is at best going to reach only the south of England. May be a lift ahead of a weather front Friday morning.

Totally off-topic - I finally managed to finish off the raised bed for the vegetables (2.2m x 1.0m) after starting the work early December - should have taken a week or so if hadn't rained so much. Also meant broad beans were only planted today - instead of 4 weeks ago, Must catch up on the rest of the gardening before the tropo lift (hopefully) arrives.

Hi all!

I got some questions about this so might some more of you are interested of my simple implementation of the Konrad-mod. I just put the Seeeduino-board in a transparent case with a ribbon cable in to the XDR-F1HD through a slot which is easily made between the two halves of the cabinet. Board is connected also to the Sonys internal 5,2 Volt so when we disconnect the USB-cable the Sony will work as normal.

Thank you Konrad for giving us this mod and softwares.

2 pics attached.

At the moment you may see the software XDR-GTK made by Konrad running at my stream www.justin.tv/sm7yes

Hmmm. I may not be able to participate much in this because of the ongoing noise problem. If signals are reasonably good they will get through but weak signals will likely be buried. Proper DXing may be limited to first thing in the morning during the week.

Good DX.

Nick, Whitchurch, Hampshire.

Hi John,

It is really impressive you monitored a meteor
burst of 5+ minutes. And I'm impressed how you got the burst confirmed.

I monitored MS actively, say starting 1978 up
until 1996, and now lately since 8/2013. I never
monitored a burst longer than 3 minutes, and that
was just a single. Some bursts 2 minutes and
less, though. Then again, I only used yagis of 4
to 8 elements, variously positioned.

** Personal Skegness 'First' via this mode

Very interesting meteor reception overnight on 102.0. I heard a lot of bursts from French and German language stations which I can only assume were very low powered transmitters - I could not find the web streams for these. The loggings above are of high powered transmitters. The stations in the Czech Republic were the most frequent.

Looks like my internet is now continuous, i.e. without any overnight dropping of service. So the computer made up for this by reporting that my hard drive was full - as it occasionally does, then it cancels the recording. I have oodles of GB left on my drives. I am sure these things are sent to try me and me only! ;O)

Not only is the internet continuous, so is my new southerly noise. There is a continuous buzz or white noise, peaking up to 20dB to the south - not as severe as at my last address, plus it dips down to 10dB or so regularly. I am mystified as to what it is. The south-east to the south-west is no good for weak DX. Although Lille and a few others are getting through, I haven't been able to hear many other regulars from other parts of northern France since moving here. These include Caen, Brest, Rennes, etc. So far, I have lost Troyes and Bourges to the noise. Thank goodness other directions are noise free.

There was a German talker on 105.3 via scatter late afternoon when I raised the FM5 to about 6 metres. I think it was Schwerin as there was classical music also in on 89.2. That would be 739km from here, same distance as Inselberg which I haven't had here so far, so this would be

my furthest scatter at the new address. Hopefully I can confirm this in due course.

Good DX!

Hi all

My first crack at Low Band FM dx-ing in a VERY long time - logged this afternoon:

Mostly english speaking but some spanish and other unidentified languages noted.

Antenna is a Band 1 TV dipole, hopefully might be able to ID a few more of these tomorrow.

Paul:

That specific frequency is assigned to the business service, so yes that would fit within the commercial airlines. The handheld radios they use put out a power of two watts, which keep their signals to with ten miles of the airport.

31006. Unid Part Jingle (German, I think)

Yahoo group: SkywavesDX (2014)
Date: 2014-03-06 13:33:15 UTC
From: John Faulkner, Skegness
Topic: 31006 Message: 31006

My longest shot ever (perhaps?)

https://app.box.com/s/vn4ewv2pd0ysu2ww34rv

While running through my overnight meteor recording today, I came across part of a familiar jingle. I can't remember who uses this but I have heard it before and hopefully our German members might recognise it. I think it emanates from Germany. It was not in // with the streams I recorded, so I think I can rule out the likes of O3, Radio Wien, Bayern 3, Big FM, DLF, MDR Info, NDR Info, Radio BOB, N-Joy, Radio Leipzig, Radio MK, Radio Top 40, SWR1, SWR3, SWR4 & WDR4.

Thanks.

John

Paul:

The cheque (or check) number 651 possibly might also refer to how many US gallons it took to refuel the aircraft, in this case - 6,510. The operator of the petrol truck could be checking the fuel gauge.

Not quite "low Band FM" but for the first time in more years than I care to remember I've tuned to the 10 metre amateur band - using my RTL-SDR and the OIRT dipole. WA3, W1, SV, RW3, AC2IQ, A92GR (Bahrein), on SSB, W5, W9. Band is wide open. I can't 'do' low Band due to 'images' from Band II broadcast occupying roughly 32-37 MHz - and tuning in reverse.I've even found SSTV on 28.680 - I don't have any means of demodulating it but have recorded the raw spectrum for a few minutes and hopefully I'll be able to find some free software.

Hello.

Now I am on a Mac although you can see some XP-windows, but the PC is virtualized in this Mac so we have a mixture here :)

In the Mac I use the program CamTwist to select a portion of the screen to act as a video source. Then we use Adobe Flash Media Encoder to stream it up to the Justin.tv-server and then from the server there can be multiple watchers without loading my broadband line. I use setting for video codec H264, 8 frames/sec with 128 kbps bandwidth, and for audio MP3 128 kbps giving a descent total bandwidth of 256 kbps and still acceptable quality. :)

You can probably find similar programs for Windows or Linux if you are not using a Mac.

94,3 RS2 in Berlin is getting better and better now during the improvement of the inversion layers although some fading occurs: www.justin.tv/sm7yes

Cheers

Hi all!

I got some questions about this so might some more of you are interested of my simple implementation of the Konrad-mod. I just put the Seeeduino-board in a transparent case with a ribbon cable in to the XDR-F1HD through a slot which is easily made between the two halves of the cabinet. Board is connected also to the Sonys internal 5,2 Volt so when we disconnect the USB-cable the Sony will work as normal.

Thank you Konrad for giving us this mod and softwares.

2 pics attached.

At the moment you may see the software XDR-GTK made by Konrad running at my stream www.justin.tv/sm7yes

Cheers!

From: Andy Pritchard
Topic: 700 Message: 31015

As others have mentioned the forecast is looking very good.

Looks like it kicks off Friday night with a break on Sunday and then a proper lift early next week although we might have to wait until later on in the week as it seems a bit too windy.

(Of course I could be completely wrong!)

I am really envious of all of you who have been getting the good low VHF scatter recently.

I tried an experiment yesterday, in view of the fact that I understood that a simple wire dipole would suffice to get me started. I rigged up a half wave dipole, cut for 36 MHz, and stuck it outside at two metres above the ground, hooking it up to my Perseus. Low VHF was very noisy so I inserted a choke which cut the noise right down to -130dB. 10m was buzzing! How I would love to get my 4 element 10m beam up now, but that's not going to happen.

Tuning above 30 MHz brought in one solitary signal around 32 MHz. I forget the frequency but Stuart and I were on the live chat and he was kindly guiding me through the band. He pointed out that I was receiving a Spanish New York taxi, but it was so weak that couldn't even hear that it was Spanish. This was my best and only catch, which proves, once again, that I just don't 'do' low VHF. Why I do not know, but it's like the tropical bands - I never had any success there either. I think I'll stick to band 2.

It's great to read the logs. I wonder if Hawaii would be possible? I guess the world is your oyster once the F2 kicks in.

Good DX!

John

From: Chris Thatcher
Topic: 31036 Message: 31042

Hi Mike,

Thanks, I'll listen out for 39.785 FM tomorrow. It's just getting dark in the UK now. US low VHF signals will soon disappear for today.

Cheers,

Chris.

31044. Maybe Es tonight

Topic: 31044 Message: 31044

Hi! I received tonight picture carrier on 49,751MHz, probably R1 from Kryvyj Rih in Ukraine. It may be sporadic E. I had no possibility to check with a TV since my RX and TV stands up in the attic at the moment. It’s a bit late to drag down 45kg TV from the attic. I don’t want to make noice and disturb my neighbours.

I made a video recording.

73’s de Chris

92.8 1009 D NDR 1 Niedersachsen, Lingen-Damaschke (nds) German pop song, as web. Vweak 477km
107.4 1051 D Radio Wuppertal, Wuppertal/Westfalenweg (nrw) Ultravox song, as web 508km
93.3 1104 D WDR 2, Kleve/Bresserberg (nrw) End of news, weather, traffic bleeps and ID 420km
101.4 1714 D Radio SAW, Brocken (san) Nice peak from all Torfhaus and Brockens. German pops 712km
107.7 1719 LUX Den Neie Radio (DNR), Blaschette/Kandel (gld) Just peaking over a very weak Kiss with soft pops, as web 557km
105.3 1722 D NDR Info, Schwerin (mev) OM sports commentary, v weak, as web 739km
98.7 1725 D AFN Wiesbaden-The Eagle, Gro?er Feldberg (Taunus)/hr (hes) Country music chart perhaps. US presenter. Almost noise free peak 647km
105.3 1728 D B5 aktuell, Kreuzberg (Rh?n) (bay) Weak but almost noise free peak on scatter!! YL speech and vocal ID 732km

Some excellent aircraft scatter again today. This is the first time I have ever received Schwerin and Kreuzberg via this mode here in Skegness. Signals were fluttery and not exactly weak either, but almost

noise free when at their best. These used to be regulars on the Suffolk coast.

Brocken and Torfhaus have also been well received and have been reaching noise-free or near-noise-free levels all day on 89.0, 92.1, 94.6, 98.0, 101.4, etc. Again, signals were fluttery, indicating aircraft scatter as opposed to stable tropo conditions.

Good DX!

Band 2 Scatter: 08-03-14:
93.5 0941 G Unity FM Birmingham, Birmingham East (EN-WMD) Asian YLs on conversation with mains hum! As web 167km **
94.0 0944 IRL RT? Raidi? na Gaeltachta, Mount Leinster (CW) Gaelic YL, as web. Almost noise free beaming SW 480km
99.2 0958 G Hermitage FM, Coalville/Hoo Ash Farm (EN-LEI) Horrible song, as web 125km
105.9 1002 G Sunshine Radio, Unlisted News and ID. Weather. Has this moved from 106.2?
89.4 1341 F France Musique, Brest/Roc Tr?dudon (29) Just audible in electrical noise 604km
87.6 1357 BEL Nostalgie Vlaanderen, Oudenburg/Zeeweg (vlg-wvl) Almost noise free. Rappers Delight song, as web 288km
103.0 1618 D BFBS Radio, Bielefeld/H?nenburg (nrw) BFBS ID and mention of the BFBS app. Becoming quite regular at the new QTH with some decent peaks 564km
93.0 1620 D SWR2, Haardtkopf (rlp) Jolly piano music, as web 593km

All tropo was inland during the morning. Continental reception was subdued, even though the tropo forecast suggested the opposite. I think the tropo forecast has been downgraded. Even Lille was struggling first thing

I swung the FM5 round to the SW where it had to rest on those poplar trees. The West Midlands was well up in strength with Sutton Coldfield reaching 56dB. Hearing the DX rolling in from inland reminded me not only of how congested the band is there, but how wide and messy a lot of the transmissions are.

Good DX!

Date: 2014-03-10 12:41:21 UTC
From: Ian Kelly
Topic: 31064 Message: 31064

Hi all. Just a quick update on what's happening at two local stations locally.

106.6 - Time 106.6 - Slough - now back to live programmes, following the recent change of ownership, due to financial trouble. However, sounding dreadful, as it sounds like they are relaying a very low bandwidth webstream. Sounds worse than mediumwave. The IBA would never have allowed this in their day! Their old website at http://www.time1066.com/ is still dead and no webstream working on TuneIn radio. Shall we have a whipround, so they can afford a higher bandwidth stream?

107.0 - 107 Jack FM - Reading - Reading 107 is no more and noticed today they have rebranded. RDS PS is JACK_fm__. Website is http://www.jackfmberkshire.com/ and live stream at http://player.jackfmberkshire.com/ . Not sure if the changeover happened today or whether I was caught napping. Don't bother sending them any song requests though - they'll only play them "the day the Forbury Lion roars" (haha - only the locals will get that one).

31065. Improving Tropo Reception

Yahoo group: SkywavesDX (2014)
Date: 2014-03-10 14:52:59 UTC
From: <davebunyan@...>
Topic: 31065 Message: 31065

A slow moving occluded weather front is slowly drifting south and tropo conditions to Belgium and Holland have noticeably improved. German stations are only slightly better than the normal weak tropo scatter. If the met office surface pressure forecast is right the front will have passed over my QTH by around 6pm - when I expect conditions to drop off -but hopefully they will improve again as the week progresses.

Thanks Tim.

That's nice to know. I was particularly looking for Hillz FM on 98.6 from Coventry but it didn't make it. It was a frustrating morning, yesterday, due to various things going on here I had switched the radio on 90 minutes before I had chance to get to it and the tropo had fizzled substantially by then.

I also had something on 89.1, so I presume Big City Radio from Birmingham. It wasn't enough to conquer Wrotham, sadly.

Looking forward to some more inland tropo.

Thanks also for the info on Wooferton on 105.9.

Cheers

** Personal Skegness 'First'

I had just switched on the GTK software, which automatically starts the XDR on 87.5. Completely oblivious to what was happening, I heard a song and then a man say "Malvisi ... ", presumably "Malvisi Network". Then it was gone. I quickly realised that this was a meteor burst, but it was stable and sustained for several seconds. This one was lucky, but I have noticed meteor scatter becoming increasingly regular and stronger over the last week.

General scatter was average again. Still very little tropo around, only a weak lift to some of the regular continental transmitters during the evening.

Good DX!

Oh yes exactly you beat me to it, that was from 2009, very very likely it will happen now, rather late in the day but better late than never. For anyone interested it seems the new President Grant II is the 'must have' cb radio for this, they are selling like hot cakes it seems...

Bring it on :)

Very good, thanks for the OFCOM update. WIll the RF output power remain at 4 watts on AM/SSB mode? Here in the United States we are allowed a maximum power standard of 4 watts on AM and 13 watts - peak envelope power on SSB.

31086. Some tropo around

Yahoo group: SkywavesDX (2014)
Date: 2014-03-11 10:52:44 UTC
From: John Faulkner, Skegness
Topic: 9434 Message: 31086

Seems to be a fine line at the moment between aircraft scatter and stable tropo, but there are occasional steady enhancements from German transmitters at Steinkimmen (some RDS), Aurich and Lingen, but sometimes from transmitters in the Nordrhein-Westfalen region.

Tropo is trying at least.

John

I've had a couple of good days with my modest receiving set up. Sunday 10th March showed steadily improving tropo for France/Belgium/Holland with the my main three - Lille/Egem/Goes giving full RDS - the first two with 0% ber. Quite a few low power stations were received including five 'new' 100 watt stations. These faded out somewhat in the later evening but were replaced by some nice tropo ducting out to the nearer German stations in a fairly defined direction towards Aachen/Langenberg.

Today - Monday 11th - reception towards Germany was again good to Langenberg, Munster, Aachen. Nordhelle, Bad Marienberg and I also picked up a weak signal from WDR2 on 93.3 (Kleve) which is 2kW and probably the closest German station to me. This evening hr-info from Rimberg on 95.0 was coming in weakly from 612km away and I also detected a very weak signal on 98.3 which appeared to be Bayern1 with a football commentary - but too weak for me to log it on FMList.

Hopefully we'll enjoy some sort of enhanced reception for the next few days as well - ful logs can be seen on the FMList visual log if anyone is interested in the detail.

Rgds

I asked Ofcom if the legalization would actually be July, seems it could be later. Crazy rigmarole to me but Here are the replies I got today...

We are still waiting for the European Commission to respond, but they are still within their timescale for a response.
Asked one of my colleagues, who deals with drafting the Exemption Regulations, and he tells me they are still aiming for the end of June.
I cannot give an exact date as to when use of AM SSB CB will be authorized as there are still some legal stages for it to go through, which are completely out of my hands. I understand from my colleague, who is involved in the drafting of the Exemption Regulations, that this is on course and within the published timescales. The Exemption Regulations then have to be submitted to the Parliamentary Joint Committee on Statutory Instruments for scrutiny, to ensure the wording and format, etc. is correct, then it is returned for the Chief Executive to sign off for final authorization.
I am not aware of any specific hold ups in the process, at the moment.

*Unidentified: **
**107.5 1605 HOL UNID Relay of Omroep Zeeland, // 87.9 Jingle and vocal
ID after ads*

Does anybody know who relays Omroep Zeeland on 107.5?

Another Dutch mystery appeared on 107.1 - a relay of NPO Radio 1. This
is an 'old familiar' from the Suffolk days.

Meteor Scatter:
CRo Vltava was today's most consistent 'burster' with HR1 coming in a
close second. Ostseewelle was also quite frequent. I was very pleased
with the two low power catches - Radio Ton Neckar Alb and Radio
Hochstift. All German streams were recorded so there was no mistaking
stations which might be relaying a common night service.

Tropospheric:
Some good Dutch DX during the late evening with Belgium and Holland with
a few personal firsts. I also logged another 25 watt Birmingham station.

The strongest signals were from Egem which peaked at 39dB. This is a
good semi-local signal strength from the FM5 which was just above
rooftop level.

I was really surprised to find that there were no continentals coming in
on the car radio when I drove into town, close to the sea front, while
this lift was in full swing. This bodes very well for the new QTH.

Noise:
My noise to the south was almost undetectable when I put the FM5
vertical yesterday. It's still nowhere near as bad as at the last QTH,
but I discovered that I can reduce it substantially when I raised the
height of the FM5 another couple of metres. I am wondering if this is
coming from the burglar alarm box which is right in the path to the
south on the nearest property to us. All other directions remain crystal
clear and noise free.

Note: Any reference to 'noise' in my loggings refers to typical
background FM mush, which is right down at 4dB or less. All "dB" figures
quoted are references to "dBf" in the GTK software. Note also that I do
not use the IF/RF boost facilities as I find these increase the general
FM background noise.

Good DX!

Thank you Janpeter. I was half suspecting this, but conditions were rather random and there were a few unexpected stations occupying some frequencies.

Much quieter conditions today. Will post the log tomorrow.

31107. Variable but poor conditions

Yahoo group: SkywavesDX (2014)
Date: 2014-03-13 10:34:35 UTC
From: John Faulkner, Skegness
Topic: 31107 Message: 31107

Conditions are quite different on the east coast today. They would best be described as "variable", but certainly not good. There is an enhancement in every direction, but nothing long range or strong by any means.

The best day was the 11th. Yesterday was not quite as good and today is not as good as yesterday, so a gradually weakening process.

Good DX!

John

31111. Local TV tropo

Yahoo group: SkywavesDX (2014)
Date: 2014-03-13 12:40:16 UTC
From: <sniffingmoose@...>
Topic: 31111 Message: 31111

Hello

Can anyone get the local TV test transmissions? I can only just get the Birmingham local TV from Sutton Coldfield on UHF channel 51 despite being able to see the lights from the transmitter 18 miles to the South West. I guess the local TV is beamed south from Sutton Coldfield.

I have also noticed that if there is a slight tropo the signal is wiped out, I guess due to inhterferance.
However today with the tropo I am getting a strong signal on channel 51 which may be coming from Mendip and Mendip is comming in on the main channels.

Any one know how I can tell which TX the test card is coming from?

Chris

Topic: 31111 Message: 31113

Hi Chris,

I'm down here in Lichfield 5 miles from the Sutton Coldfield mast and have line of sight to it. The C51 mux is much lower power and beamed south away from us, so even here it is considerably weaker than the others. There is also Bonanza Bonanza along with the Local TV Test Transmission test card, dunno if that helps you confirm which TX you are getting today?

Chris Howles (Lichfield)

31114. Re: Local TV tropo

Yahoo group: SkywavesDX (2014)

From: <sniffingmoose@...>
Topic: 31111 Message: 31114

Yes interesting. I will have to wait untill the service starts to really confirm. The Test Transmittion on channel 51 keeps coming and going here as I type.

As for the Tropo, I have been getting a lot of the low power small welsh TX's on Band 2.

Classic FM Wenvoe has been interfering with my local radio station Touch FM which is relayed on 102.4 from a water tower a few yeards behind the house. The relay is relaying the main station Touch FM on 101.6 from Lichfield but as wenvoe is on 101.7 and now stronger than Touch FM from lichfield, it becomes strong enough to knock the relay off the air due to the extreme interference.

A bet the listening public go out and buy a new radio!

Also Radio Devon from North Hessery Tor on 103.4 has been coming through quite a strong signal.

On DAB I am getting Oxford Mux and Hereford & Worcester Mux. Nottingham Mux is knocked out here today guess due to interference.

Chris

My favourite SDR program for use with FCD is HDSDR, available at www.hdsdr.de.
To decode RDS, you will need RDSSpy (www.rdsspy.com) and a "virtual audio cable".

73,
Günter

I'd give SDR Radio a go – http://v2.sdr-radio.com/

It is more complicated than SDR Sharp but much more versatile.

It is excellent on VHF FM, including an RDS decoder.

There is a very active Yahoo group where you can get advice etc.

It's only a tight duct to Lille and Tournai!

Lille is a very large 47dB (GTK software without any IF/RF gain), which is almost as strong as Tacolneston's 56dB. I don't hear any other real enhancement, apart from a weak lift into south-eastern England.

I wonder if this is going to build as the evening progresses. I expect it will disappear or become much weaker and variable, as all the other DX has been all day.

Good DX!

John

To: SkywavesDX@yahoogroups.co.uk

Remind me, where are you Martin?

Strange condx here, with the whole of England and Wales foggy; IRL pretty strong, 87.6 audible, Wrotham drowned by Kippure off the back of the beam (wrong polarisation) but Crystal Palace strong

- Julian, Stockport

>>I’m getting a slight enhancement in all directions this morning in London. Holme Moss is booming in, and BBC Radio Cymru from Wenvoe on 96.8 (quite rare here) is very strong too. BBC Radio Norfolk on 104.4 is at reasonable strength, but nothing too exotic can be heard at the moment.

Regards,

Martin<<

Mostly inland enhancements today. The early morning period showed an enhancement in all inland directions, but the continent remained only slightly enhanced.

The middle part of the afternoon showed a big enhancement to Lille and Tournai. I was waiting for sundown in the hope that conditions would improve further, then I was going to put the FM5 in the vertical plane, but conditions had gone "fizzle" by then so I didn't bother. Admittedly, a little bit of lethargy has set in after the good conditions on the 11th.

Good DX!

Good tropo to SE England including a pirate on 87.5 called Vibe Essex with lots of ads and promos. Funny that when you go to their website you get the following statement:

WWW.VIBEESSEX.NET IS A ONLINE INTERNET RADIO STATION WWW.VIBEESSEX.NET IS NOT AVAILABLE THROUGH ANALOGUE RECEIVERS IT IS ILLEGAL TO RECORD REPRODUCE OR REBROADCAST WWW.VIBEESSEX.NET IN ANY WAY IF ANY INDIVIDUAL SHOULD USE OUR MATERIAL IN ANY OF THE ABOVE CIRCUMSTANCES WWW.VIBEESSEX.NET WILL NOT BE HELD RESPONSABLE
Also WDR 4 was in on 100.5 from Teutoburger at fair levels a little earlier, weaker now and a weak hr3 from Biedenkopf on 87.6.

Good DX.

Nick, Whitchurch, Hampshire.

Yamaha T-2, Denon TU-800L, Kenwood KT-1100SD (modified), Yamaha T-85, Sony XDR-F1HD tuners, Triax FM5 horizontal beaming east.

From: Tim Bucknall
Topic: 31136 Message: 31136

please forgive the CC Gents,
29.140 BC Harm 4 x 7285 1325ut mod too low to id language
29.165 SE Asian AM CBers w/ Roger beeps via E Tep 1329ut (Darwin
28.268 bcn present)
29.2125 Asian Fisherman in NFM 13:30ut also 29.8125 w/ E tep flutter

29.705 Aussie Buoys//29.760, 29.825 29.870 decoding attempts failed 1335ut

30.825 Asian BC Harmonic primitive wailing, never hrd anything like it
before, i can't even guess the country off 14:00ut 6165 x5, strong
pks but w/ flutter
MW list suggests VOV 4, Hanoi

31.575 The Jumper, East Med 1346
31.75 unid language comms but completely trashed by UK paging 1350
32.8 Kazan Radar 1346
32.825 unid lang comms or bc harmonic, but trashed by Kazan 1355
34-35 Turkish Fire comms on many freqs, didn't bother noting them as
was concentrating on Far East 1330-1412ut

FM Tropo
87.5 London Pirate- very poor, usual dance 1235ut
87.9 Omroep Zeeland Goes pops
92.6 NOS 2, Lopik on car radio 1313ut
101.2 Unique FM, London 1412ut

DAB was such a mess of co-channel signals not even the locals would lock.
Nothing of interest noted on UHF DTV
just the usual 4 regions, North West, Yorkshire, West Midlands & East Midlands

Fog got so heavy we had to abandon dxing and head home

Nice, but what is the service frequency of X-10?
My first ever dx frequency book (Wireless World Transmitter List) was about 1960 and there were a few S. American stations listed IIRC on 44MHz ? but I'm sure there's none there now ;-) I presume this was a remnant of the original USA VHF Broadcast Band where both AM and FM were used in the USA for a few years in the 1930s
- Julian

Jurgen:

Congrats on the pick-up of Argentina STL for X-10 on VHF-low band.
Have you ask what antenna polarity their antenna uses?
If not you might get better reception with vertical.

31141. Noise Images and some observations around town

Yahoo group: SkywavesDX (2014)
Date: 2014-03-15 09:53:25 UTC
From: John Faulkner, Skegness
Topic: 31141 Message: 31141

Here are two screen grabs of some noise I recording overnight. I am guessing this is thermostat or timer related, probably the latter in view of the fairly precise lengths of the noise bursts, though I have seen this happening for slightly longer durations - perhaps doubling this time.

Overnight 15-03-14
https://app.box.com/s/nj64bdqvbkkr2sysekf6

Overnight 15-03-14 (Close Up)
https://app.box.com/s/c4w2voenxzb1dn2m3226

Typically, the noise goes up and down in strength with regularity, and it does it abruptly but without a click or additional noise. As you will see, the noise spikes came in blocks of 14 minutes and 10 seconds when at its strongest. The noise is a white noise, as you would hear on an empty FM frequency. When the noise is at its quietest, it produces a slightly raspy 50Hz hum.

Has anybody seen anything quite like this before?

This came about accidentally tonight as I had positioned my antenna to the east for meteor scatter, but the strong overnight winds here swung it round to the south.

I still consider the new QTH to be very quiet on the whole. The noise to the south is still nowhere near as bad as where we used to live and the FM5 when vertical almost loses it completely here. Putting the FM5 higher up also reduces the noise to an acceptable level.

While trialling the XDR GTK software on a laptop in the car yesterday evening, together with home made FM whip, I was staggered to hear a huge amount of noise around town. All residential areas I drove through had white noise here and there. I could only estimate that at least 50-60% of properties were subject to noise of one type or another. One particular hotel, close to the sea front, with bright,neon signs wiped out the entire FM band for two hundred metres around it. I watched the XDR glow as I drove along the main drag (Grand Parade), past the pier and other seafront attractions.

No noise is good noise!

John

This is a log of everything heard on the 14th, with the exception of a
few of the regular continental transmitters. Nothing new was heard.

Tempting fate as usual, the tropo subsided substantially about 30
minutes after I started my Ustream broadcast. Conditions had completely
gone by the early evening.

Good DX!

I would find it so much more useful if these logs were posted in frequency order as Jurgen does (though Jurgen□s first column is not frequency which is distracting). I though the time vs frequency order debates were settled in the 1980s? Certainly BDXC□s Communication, MWC□s MWN, DSWCI□s SWN etc have all logs in frequency order.

Cheers

Stuart

This is a log of everything heard on the 14th, with the exception of a few of the regular continental transmitters. Nothing new was heard.

Tempting fate as usual, the tropo subsided substantially about 30 minutes after I started my Ustream broadcast. Conditions had completely gone by the

early evening.

Good DX!

> so I don't expect a lot of extra work.

FMLIST Logbook has three export options: by time, by frequency, by country.

Let me remind you that you can export your complete logbooks, if you want to make your personal backup copy or for any other purpose: Just select "ALL" or a year from the "Select date:" dropdown, and, once the page has reloaded, click on "Export (CSV)". The file can be opened in Excel and many other programs.

Talking about backup: We do make daily complete database backups on the FMLIST server (usually at 00:30 local time, i.e. 23:30 UTC), these are transferred to a separate system at separate premises, and archived.

73,
Günter

31160. Organising data from FMList Logs

Yahoo group: SkywavesDX (2014)
Date: 2014-03-15 19:56:25 UTC
From: <davebunyan@...>
Topic: 31160 Message: 31160

Apologies if I'm telling everybody things they know - but having read some of the comments about preferring logs in certain formats I thought I might be able to help. 1. If a log of reception has been posted in this Group you can copy the log entries by clicking on the first entry, holding the key down and dragging to highlight the whole log, The right click and choose Copy. Then Paste it into Excel or Open Office Calc using the Paste Special option Unformatted Text. You can now highlight the data in Excel and choose the Data\Sort Option - Column A - Ascending - and it will be sorted in order of frequency provided the posting starts with the frequency
2. If you export your log from FMList using the csv option - it won't open properly in Excel - you need to rename the file with a txt extension. Then when you open the file you are presented with a Text Import Dialogue box. In Step 1 leave the default Option. In Step 2 click on the semicolon option and you will see the table appear. In Step three highlight the column holding the date and click on the DMY option. Finish and the table appears in Excel. In OpenOffice Calc when you click on Open choose "Spreadsheets" from the drop down menu instead of "All Files". You are presented with a Text Import Dialogue box. Ensure the button Separated by is active. Click on the option Tab and then click OK - data will then be correctly presented.
3. You can then manipulate the data using Data/Sort Option - BUT before doing this save the spreadsheet - so you can undo any changes. Then you can do summaries using Pivot Tables (Excel) or Data Pilot (OpenOffice).
4. You can of course then filter and copy/paste to the Group as you wanr.

I find that having summaries of my logs makes it a lot easier when chasing DX - I can easily, for example, just show stations previously received from DNK and NOR so that I know what frequencies to check first if there is a promising opening.

One thing that I woukd find very helpful with the FMList database would be to get the data (by country) available in the Download section in csv format as an then be sorted in a spreadsheet. One could do all sorts of clever things such as "show me all the transmitters with a certain azimuth range" across the FM band for the country in question. Combine a few countries then for tropo you could see who is where in relation to each other. [Note - my day job involved data analysis].

Hope there is something useful for someone in this post.

Rgds

31167. DEMO: antenna comparison

Yahoo group: SkywavesDX (2014)
Date: 2014-03-16 00:23:57 UTC
From: ilkka suni
Topic: 31167 Message: 31167

Hi folks,

EVERY NOW AND then, there is discussion on different antenna types
and their gain, as well as antenna positioning.

This is a comparison I made in August 2013:
http://www.fmlist.org/fm_media_show.php?id=2400122&media=sound&itu=EST

THE STATION you hear is [EST] Vikerraadio, Koeru 105.1 Mhz, a daily
regular. Horizontal polarization, 6 kW tx-power, 276 km from my QTH.

The antennas on my audio clip are the Triax FM5 and the 8-element
yagi VKN of late 80's.
I had bought the FM5 a few weeks earlier and I was trying to locate a
convenient position for the antenna,
to take my 8-element yagis down for repair and maintenance..

THE STRONGER signal i.e. the better audio is by the VKN-8, which by
the way I have not maintained since last millennium, and I have
noticed there is lack of balun/cable connectivity.

The VKN-8 stood 10 metres above ground level, the Triax FM5 stood 6
metres agl.

No local obsticles affecting. The antennas stood on separate poles,
some 3 metres apart.
So called dead zone, sweet spot elements ruled out by a couple weeks
of postitioning experiments.

QRM on the clip is by the 10 kV power line, some 30 metres away: it
occasionally gives noise.

73, ilkka
[FIN-Joutseno]

Many thanks Paul, I'm already browsing thru your site which is pretty useful.
I understand that there's a lot more interesting stuff than NYC Limo services but I'm only beginning, while waiting for the Sporadic season to start in a couple of months; earlier this week I had what sounded like North African military (French with Algerian accent) on 30.875 Mhz, i even grabbed a callsign DR 'delta romeo"; today's weather looks promising.

Thank you for this David. Very useful indeed. I was not aware of all these procedures so this is very welcome.

Databases are such useful and clever things, but they can be difficult to understand - they always have been for me. Formatting has been the bane of my life.

It is amazing what can be done with a database once all data has been entered correctly. I wish they'd been around for me on computer back in the 70s.

Cheers

John

From: BEAVAN SIMON
Topic: 31190 Message: 31190

I wonder if some of you people can help an electronic ignoramous.

I have a 5 element antenna (indoors unfortunately at the moment) that has been connected to a Sony tuner and doing as well as can be expected in the circumstances.

I now have an Elad FDM-S2, which , just to try things out, I connected to the antenna via an old TV/Radio distribution amplifier and things appear to be working.

However, I've found that when the Sony and Elad are both connected to the amplifier, the signal on the Sony drops (Enough to lose RDS on the nearby Wenvoe transmitter ! - With the antenna pointed away from Wenvoe). This doesn't seem to just be due to losses in the amplifier, but just when the Elad is connected.

Now I've spotted that the Sony is 75 ohm and the Elad is 50ohm. Is this likely to be the cause of my problem ? If so, what do I need to do ?

Going forward further, I'm sure that my old TV amplifier isn't the ideal way to split the signal from the antenna. Can anybody recommend a decent splitter for weak signal work ?

Thanks

Simon

The inputs on your old amp are probably not well isolated and so you have mutual interference between the inputs with all sorts of complex impedances. Normally the 50/75 ohm mis-match is not worth bothering about for receive only situations.

You can make your own splitter, buy a new passive one (RF Systems, Diamond), buy a new distribution amp (HS Pubs)or just move leads manually.

Cheers

Stuart

I have a 5 element antenna (indoors unfortunately at the moment) that has been connected to a Sony tuner and doing as well as can be expected in the circumstances.

I now have an Elad FDM-S2, which , just to try things out, I connected to the antenna via an old TV/Radio distribution amplifier and things appear to be working.

However, I've found that when the Sony and Elad are both connected to the amplifier, the signal on the Sony drops (Enough to lose RDS on the nearby Wenvoe transmitter ! - With the antenna pointed away from Wenvoe). This doesn't seem to just be due to losses in the amplifier, but just when the Elad is connected.

Now I've spotted that the Sony is 75 ohm and the Elad is 50ohm. Is this likely to be the cause of my problem ? If so, what do I need to do ?

Going forward further, I'm sure that my old TV amplifier isn't the ideal way to split the signal from the antenna. Can anybody recommend a decent splitter for weak signal work ?

Thanks

Simon

31193. First 2014 tropo dvb-t Germany in my new home

Simon

I believe the Elad SDR has both a high sensitivity & low sensitivity FM mode to minimize overloading? Two enthusiasts in the States assert that it handles strong FM signals extremely well.

Although extremely robust, the XDR-F1HD, S10HDip et. al. will suffer from images where they should not be (just like every other tuner). However, those instances have only been noticeable at two very different urban locations; one in Queensland & another in New South Wales. In both cases, it was due to extremely well-elevated 100 kW public broadcasts within 15 km.

I prefer to use a wideband masthead -> an FM bandpass filter with adjustable gain -> two way F-type splitter. This way I can 'tame' the preamp gain if images happen to present themselves on one particular receiver/tuner. (I admit the Yamaha TX-540 is usually my weakest link in this regard). I'm more afraid of extremely weak signals than overloading!

Good DX!

The main transmitters from Lille and Egem are coming in at 50dB! Pure FM from Wavre (nr Brussels) is up at 47dB - which is 100km further away than Egem. During the day I've had some reasonable tropo reception to the south with French transmitters from Brest, Reims, Charter and Rennes - and south is not the best direction for tropo from my location. This is possibly the strongest I've seen.
Just checked Goes (HOL) and R1 on 104.4 is 42 dB

Some tropo here too. Lille frequencies are 4 bars on the Denon, and Wrotham is 5! I'm also getting Langenberg at up to 2 bars but it isn't as good as it should be because of the ongoing QRM across the band.

Speaking of which, an engineer from Ofcom will be visiting a week on Friday so fingers crossed and we'll see what happens.

Good DX.

Nick, Whitchurch, Hampshire.

Nothing particularly interesting in London except BBC Radio Cymru on 104.3 from Llangollen. I don't know how that transmitter gets out so well, as it's a fair distance away and only medium power. BBC Radio Cymru on 96.8 doesn't get out nearly as well, despite being nearer and very high power (I know it's slightly directional, but not that much).

Holme Moss is booming in, and Caen is occasionally coming in on 91.5 via aircraft scatter.

Regards,

Martin

31218. Re: [SkywavesDX] Denmark on Tropo

Yahoo group: SkywavesDX (2014)
Date: 2014-03-20 09:44:51 UTC
From: John Faulkner, Skegness
Topic: 31211 Message: 31218

Some unexpected tropo and, as others have been saying, strong signals from Lille and other regulars. Decibel 97.6 currently holds the "dBf record" at the new QTH at 43dB. As usual, this is without the IF or RF boost on the GTK software (which I don't like as it induces more 'brightness' in the audio which spoils the overall sound for me). Not bad for a not too high B&S (Bodgitt & Scarper) FM5 which blows around in the breeze and practically sits on the rooftop!

Congrats on Denmark Dave. It didn't make it here. Had I been up half an hour earlier when you reported it I'll never know, but the tropo dropped away quite rapidly. Northern Germany (NDS & SHS) were the predominant areas here, but most of the tropo was weak, unlike just before midnight last night, signals were good from all the regular continental scatterers.

Hopefully more tropo by the end of next week.

Good DX!

John

I pushed recently a new IF noise reduction plugin for SDR# that might be useful for FM DX folks (you). It can be combined with the original audio noise reduction. I invite you to give it a try. Feedbacks are welcome.

Oh well - we had a few days of good weather - and good dx - although the dx was confined to the southern part of the UK.

Lawns mowed, hedge trimmed, early vegs planted under cloches - so should be OK if it turns cold.

BTW I got a good recording of Denmark P£ on 97.2 - reception was quite clear at time which was more than could be said of the audio quality itself as someone was being interviewed whilst they were moving (on foot?) and the sound was very wobbly for want of a better description. Sound from the people in the studio was good - and I put a few seconds of the webstream at the end to prove it wasn't weird propagation conditions! Here is the link https://app.box.com/s/0b905j2i7whps0vobz09 https://app.box.com/s/0b905j2i7whps0vobz09 the short gap at 38 seconds is the break between the off-air recording and the web stream - but the two are not sync'd

31230. Reflection via space station ISS?

Yahoo group: SkywavesDX (2014)
Date: 2014-03-21 19:45:32 UTC
From: ilkka suni
Topic: 31230 Message: 31230

Hi folks,

THIS IS AN ISSUE which came up in November 2013, by the time the satellite GOCE was about to crash.
There was speculation over the possibility of getting an FM-reflection via the space station ISS.

I was very sceptical, at least considering my potential. For one thing, the ISS orbit at its closest remains some 700...800 miles from my QTH.

As Mr Jean-Louis Rault of France, the former president of AMSAT France operations demonstrated to the Skywaves group in November 2013, he and his ham operator friend had succeeded in getting an 144 MHz ping via the space station MIR, in the past.

Has any of you folks, tried let alone managed to get a potential FM-reflection via the ISS?

OVER THE PAST four months or so, I have tried occasionally. Some last weeks, I have tried systematically.

I have relied on the n2yo sat-tracking site. And I have reason to believe, there are just too many convenient incidents i.e. pings, to be a hoax, to be a total false. It also comes to the nature of the pings: their duration and the audio, including the doppler effect etc.

Then again, I could be totally wrong..

I apologize for my lousy English.

Hi Michael, thanks for the comment.

What I have noticed, considering my location with the elevation and azimuth. It is not for granted, every time the ISS happens to get conveniently close, one gets a reflection.

From my angle, I believe It is about the space station's position, in respect to certain transmitter sites.

It has taken me quite some time and effort to draw conclusions. It also is crucial, to recognize the actual MS chart. It takes weeks and months, daily standing noise and monitoring certain frequencies and pings by certain transmitters.

I have reason to believe, I have a positive FM-reflection via the space station ISS. Then again, I could be wrong.

Hi Ilkka, One suggestion - but I know nothing about it really - is that you or someone close to your location could monitor the ISS Ham radio frequency - I understand they use NFM on 144.80MHz. That way - if their ham station can be heard at the same time as you have recorded FMBroadcast activity - you've got confirmation ISS was line of sight.

You also need a fellow FM-Dxer with a high gain aerial in the same area to monitor at the same time as you do.

Slightly off-topic - but I remember back in the 1970's when a satellite was commissioned to transmit analogue TV signals on the UHF band to India - a DX-er in this country built equipment (parabolic dish and FM demodulator) especially to try and receive it - and the grainy pictures were published in Practical Television. No-one expected that to have been possible as it way out side even the fringe reception area. (I'm showing my age!).

Hope you can get confirmation that this is reflection from ISS.

Rgds

David

Ah, and I forgot. I only have monitored FM for some 35+ years, let alone MS.

My mind must have got spinning around, after all those hundreds,
maybe thousands of hours of real time MS-monitoring. One must see, I
don't record and analyze afterwards. I listen to each ping as it happens.

31241. Flag Antenna at 30 MHz?

Yahoo group: SkywavesDX (2014)
Date: 2014-03-22 23:17:43 UTC
From: John Faulkner, Skegness
Topic: 31241 Message: 31241

I keep thinking about installing an antenna for low VHF. I tried a half wave dipole but there was too much electrical noise. I don't want to spend much time on this and have been wondering about simple but affective alternatives. I think a loop would be more than I willing to do right now, especially as the high MUF might be lowering soon.

What about the flag antenna? I suspect my MW flag would not tune well to the top of HF/low VHF, so I wonder if a half size flag would do the trick? I would use the same 3:1 transformer (six turns to 18 turns) to feed as it is already constructed. Would this still work in the low VHF range?

Thanks

John

Hello John and everyone.

I received upper HF and low VHF with an indoor flag (installed for MW), and even a broken UHF TV aerial in Blackpool UK.

I used a horizontal wire dipole cut for 33MHz on a balcony wall in Cairo, Egypt. As in these examples:

Blackpool 2012 (Alinco DX-R8 SDR mode)

Thank you all again for your replies.

Jurgen: Getting up to 22 MHz sounds better than I expected. I had always thought the flag was only good up to 5 MHz but recent reports I have been reading suggested otherwise.

Paul: I will give this a go today. It sounds straight forward but I may use the MW flag transformer if the noise is high. The noise was pretty bad above 30 MHz (not quite as bad below) with the dipole I cut for 35 MHz, though it was only two or three metres above the ground to be fair.

Yes, I did mean 9:1. I quoted the turns ratio as usual.

Peter: You suggested the indoor flag not long ago but I was reluctant to try this indoors. There just isn't enough room indoors anyway. It would go outside if at all.

As I said, my aim is for simplicity as I don't think this high MUF is going to be around much longer. I see the figures falling slowly on the DLXC site.

Thanks again

John

Hi David,

YOU WROTE:
<<<<<Hope you can get confirmation that this is reflection from ISS>>>>>

ACTUALLY, I DO not know who is one to confirm, or how to get things confirmed.

Since early December i.e. the GOCE discussion, I have monitored tens
of flybys by the ISS.

The frequencies when monitoring, I must select. My favourite
frequency for the ISS is 92.4 MHz, which is my basic tropo indicator
to Sweden. I often have my tuner hissing on the very frequency,
alerting for tropo or MS, especially MS from Germany, as Germany is
my primary target to collect vocal MS-IDs.

YOU WROTE:
<<<<you've got confirmation ISS was line of sight.>>>>

I AM NOT SURE I know what you mean by "line of sight".

One may check out this site:
http://www.n2yo.com/?s=25544

Check the column "draw footprtint" and you find the area, to which
the ISS travels above horizon.

TAKE THIS morning March 21st. There was virtually no MS.

The ISS came traveling from the SW, arriving above Germany. I got a
rapid reflection by
[D] SWR1 Rheinland-Pfalz, right as the ISS traveled above or close to
the transmitter [according to the sat-track site].

Next, there was a noticable reflection by
[D] RBB Kulturradio Berlin, right as the ISS traveled above or close
to the transmitter [according to the sat-track site].

Next, there was a brief flash by a tx I could not identify.

Finally, there was a noticable reflection by
[POL] PR 2 Klodzko, conveniently when the ISS acording to the
sat-track site traveled by the tx.

I have it all on video and audio tape. Was it all just a coincidence?

THE ISS TRAVELS some 400+ kilometres above ground level. So being, it
can only serve as a reflecting object, othwerwise the ISS was a burner-up.

Should the ISS travel above or very close to the transmitter,
presumably reflected? Or should the ISS travel somewhere inbetween
the transmitter pinged and the receiving QTH?

What do you think, David?

MAYBE IT WAS just a coincidence, the very morning March 21st there
just happened to conveniently be MS matching the ISS path, matching
live streams.

Then again, there is certain difference to reflections by a man-made
object or a meteor. How the rfelection cuts in and cuts out, for
instance. How strong the burst is, the signal level.

I just would not know.

YOU WROTE:
<<<<<You also need a fellow FM-Dxer with a high gain aerial in the
same area to monitor at the same time as you do.>>>>

What is a high gain FM aerial like? Back in the 80's I noticed,
nothing less than an 8-element yagi for FM. I would not know, how
much antenna gain is needed to receive say 2...100 kW FM transmitter
reflected from 400 km above the Earth.

What kind of transmitter power do ham operators have, when they work say EME?

From: John Faulkner, Skegness
Topic: 31264 Message: 31264

Band 2 Meteor Scatter: 23-03-14:
107.9 0058 D Radio TON Neckar Alb, Sickingen/Wasserturm (bw?) Slow pop song, as web 806km **
107.9 0114 D R SA, D?beln (1kW) or Auerbach (100W) Blues rock track, as web **
107.9 0152 D delta radio, L?beck Berkenthin (shs) Billy Idol styled song, as web. Two second burst 690km **
107.9 0154 D Rockland Radio, Hohe Wurzel [hes] 6.2kW or Bitburg (100W) Heart song, as web **

** Personal Skegness 'First'

I recorded 107.9 once again in the hope that I might catch some low power German stations and tonight I got lucky!

I was able to record all German language web streams, including those from Austria, with the exception of Einslive which already comes in well on scatter. This way I would be able to determine which stations were carrying shared overnight programming, thus recucing the risk of logging the wrong station. And another surprise - I never rexpected to hear such regularity of two low power stations.

Radio TON Neckar Alb and R SA became the most common bursters on this frequency tonight, whereas they were not heard at all on previous nights - I only heard the higher powered regulars. Rockland Radio was also a nice catch, but both Rockaldn and SA have two transmitters on the frequency so I cannot be sure which one I received.

Another interesting thing is that all loggings and observations were made within the first hour of monitoring. Meteor scatter suddenly dropped down after this.

Despite a very disturbed day with thunder storms, scatter has been superb.

Good DX!

Hello Ilkka.

This was discussed here last year and there was a reference to another website which covered the subject in great detail. As usual, the search doesn't work on my computer so I cannot find this. Please could somebody re-link to this.

From what I recall from the article, it was considered virtually impossible to catch meteor scatter from an FM broadcast signal beyond 2000 km - and I have never done so myself. The reasons were given and it was stated that there was a sudden and sharp fall-off in signal strength above this distance. Recent discussions here have considered possible extensions of this distance due to interaction with tropo or some other enhancement, though it was speculation.

Look at this matter from an amateur persective and you might imagine that this distance is slightly further due to the use of more specialised equipment, but even here I am struggling to find anything over 2000 km. Query the DX Maps database for this information (you'll need to be logged in) and I found only two instances in the last six months.

28/12/13 14:05 K1SIX (FN43AD) 50.125 W9DR (EL86XV) 2022
MS MS TNX
28/12/13 10:40 EA1YV (IN52OC) 50.23 OZ1JVX (JO46FR) 2036
MS HRD WITH YO5LD 26
30/12/13 10:46 E77GS (JN84) 144.358 EI3KD (IO51VW) 2029
MS JN84<MS>IO51 FB 2024KM HNY

I also found these:

23/03/14 20:34 FIN-Joutseno (KP41FC) 92.4 Lyon (JN25HJ)
2331 MS not confirmed by anyone
19/03/14 18:04 AD5YB (EM54NK) 28.507 LX1AX (JN29XM)
7487 MS 5/9 IN MS
18/03/14 18:35 KX5M (EM12SR) 28.477 MJ/K3PLV (IN89VF)
7599 MS 59 IN MS
23/03/14 14:45 WB0WQS (EM37) 28.012 HF15NATO (JO73GK)
7746 MS CLIPPING ALONG AT A GOOD PACE
22/03/14 16:09 OK2POI (JN99BL) 50.107 V51YJ (JG87NJ)
8013 MS SOME TIMES MS BURST

Make of these what you will, but maybe there really were meteor enhancements mixed in with other modes.

As for low power FM broadcast transmitters, I wouldn't have believed it possible either. It was thanks to the diligence and the eagle-ears of

people here and via my YouTube page that I discovered the 40 watt Austrian transmitter. I was speechless and did quite a lot of digging behind the scenes to seek confirmation. One other thing, had it not been for the almost full RDS I had from a 200 watt Swiss station in December 2012, I would have doubted this even more.

I have made taken some videos of my stream recording and meteor comparisons to show this in action and once I have enough footage I will present a compilation and write-up on my blog. It has really opened my eyes to the possibilities of meteor scatter. But the 2000km distance factor remains in question. I record streams of high power DX just over the 2000 km range and I have not observed a single instance of a 2000+ km meteor reflection. I don't dispute this is possible, but so far I do not see any evidence to support straight MS reflections up to the 2100 km limit or beyond, at least from searching DX Maps over the last six months and from my own observations.

Hi Ilkka,
Let's add my 'penny worth'

On 7th Nov 2013 on 87.7 MHz at 17:07 UTC I captured France Musique - with PI Code F203 and most of the station name "MUSIQU--" - I've noted that the signal lasted 90 seconds. Only one transmitter is listed for this frequency - 100watt power and 782km from my QTH
When we were discussing maximum distance on MS last year I did some searching and found references from Australian amateurs regarding M-S reception enhanced by tropo enhancement at the far end of the path and your reception at over 2400kn last year apparently coincided with good tropo over Spain.

On SpE during the 2013 season I had a number of stations with only 50 watts output (according to the listing) all strong enough to give a PI code and most with at least part of the PS - as below. So a strong meteor trail should behave similarly. I've double checked FMList and none of the programs have a transmitter on adjacent frequencies that could have given a false reading.

And incidentally yesterday on the10m ham band I heard a Bulgarian station on SSB quite clearly stating that he was running one watt (calibrated) of power - I was using my dipole for the OIRT band (2m total length - and badly mis-matched). I have dug out my old Lowe HF225 which hasn't been used for probably 10 years.

I WOULD LIKE to read this article, too. Was it by a radio hobbyist,
by a scientist?

John, do you think, a 1 kW FM-transmitter 2254 km away, 470 m asl,
would be possible to receive via MS?

At 11:16 24.3.2014, you wrote:
><<<<<<<<<<I record streams of high power DX just over the 2000 km

Very interesting. As you say, better late than never, and hopefully it won't be all 48/64 kb/s slots. If they relaunched the MUX using the same bit-rates on DAB+ we'd have decent sound quality at last.

Good DX.

Nick, Whitchurch, Hampshire.

Yamaha T-2, Denon TU-800L, Kenwood KT-1100SD (modified), Yamaha T-85, Sony XDR-F1HD tuners, Triax FM5 horizontal beaming east.

I was wondering when they would test DAB+ because we know it has to come.
Then they will have to tell people the DAB radios they bought won't work when DAB is closed down.

I wonder if they will dual run DAB/DAB+ as the burning question is can they afford it.

Andy

Hmm why would we need dual format tests ? Long overdue, hopefully the commercial stations will test also soon, not that we needs any testing of course just launch the flipping service ;-)

DAB+ seems to be doing quite well down under btw. I have a friend in Melbourne who was a great fan of am stereo, now they are in mono he is overjoyed all his favourite AM stations are all on DAB+

G'day Nick

Initially upon launch, DAB+ in Australia used high bit-rates. Presently here in Brisbane, the highest two broadcasts are 104 kbps AACP (both commercial broadcasts aimed at the baby boomer demographic) whilst some of the better contemporary stations are much lower, e.g. Koffee at 88 kbps and noticeably sound more artificial. The problem is that these bit-rates vary from quarter to quarter & seemingly change at the network Programme Directors' discretion as temporary stations are added; there is no guarantee they remain relatively high.

I'd be interested to know what bit-rates are used on music stations in European countries with DAB+?

Good DX!
Leigh

Impossible to answer this. "Perhaps", but even the last six months of MS
activity on 6m and 2m makes it look 2100+ km look unlikely. Perhaps a
longer sample period will reveal more.

Ironically, Dave even some 12 months after the DAB+ launch in Brisbane, 4BC was still broadcasting in AM Stereo! Kind of a waste, since it was talk back, although the NRL coverage sounded good. Not sure about the current status of AM Stereo in Australia since I sold my AM Stereo receiver around 2010.

I have fond memories of 4QR (now 612 ABC Brisbane) broadcasting in AM Stereo from the early 1990s. Talk back format, but has always aired a lot of excellent adult contemporary rock & country/folk.

Good DX!
Leigh

Last time I was there, bit-rates were higher & coverage better than Brisbane (Melbourne's flat, Briz & Sydney are hilly) but it's respectable.

Good DX!

This country is so backward in some ways. I wouldn't be surprised if the next generation of DAB arrives before we get as far as DAB+.

Nice one Dennis. Definitely don't try to fix something which isn't broken. Spot on!

Hi Paul and All,

In Finland we have at least the following:
FM fans => fmdx.tk
SWL (mostly) => Suomen DX-Liitto
Hams => Suomen Radioamatööriliitto
Finnish radio station scene => Mediamonitori

You're welcome to join! Most of the stuff written there is in Finnish, but everyone will respond in English whenever needed. Google translate has also improved a lot recently, so you'll get at least some idea of the content...

73,

Jukka

31299. Skegness Video Bandscan - 25-03-14

Yahoo group: SkywavesDX (2014)
Date: 2014-03-25 21:26:21 UTC
From: John Faulkner, Skegness
Topic: 31299 Message: 31299

My low VHF DXing is a joke. At best I have heard some burbling noises around 32 MHz, but nothing in the way of voices. I have been using the loop antenna as suggested by Paul Logan, getting it up fairly high in the air, but nothing! I think I may as well give up.

Thankfully band 2 has been more generous to me. Conditions are at best only average, but I got the FM5 a little higher again today, clearing the rooftop by a couple of metres and it seems to have made a difference.

Putting the video together was a nightmare though, so I don't think I'll be doing this again in a hurry. Sony Vegas crashed with great regularity. The resulting audio is poor too, but there are some decent examples of aircraft scatter in the video.

http://www.youtube.com/watch?v=ebUpQcHahT8&feature=youtu.be

Good DX!

John

Hi,

In following this conversation regarding what is and isn't possible I reckon it deserves a separate topic of it'sown so the information/discussion can be easily added to by others.

So I will start it off as I'm fascinated by weak signal reception.

31305. METEOR SCATTER PROPAGATION - WHAT IS POSSIBLE?

Yahoo group: SkywavesDX (2014)
Date: 2014-03-26 10:21:32 UTC
From: <davebunyan@...>
Topic: 31305 Message: 31305

This topic has been going back and forward over a period buried in various conversations - and needs a topic of it's own so that information can be shared.

The discussion needs to be in the context of FM-DX reception as amateur radio uses different techniques eg the world record distance on 4 metres (2314km) took 58 minutes to complete the QSO but for FM-DX the station identifications needs to be made in a single burst.

Programme identification is one thing - transmitter location is another - as there are quite often a number of transmitters carrying the same program on the same frequency (stating the obvious) and at differing powers and from my own modest set up I have received stations running between 1 and 5 kw - with PI Code and station name on frequencies where there is only one transmitter carrying the program. So assuming that the highest power transmitter,on frequencies with multiple transmiiters, is the one received may well be incorrect.

So in order to answer the questions - what is the lowest power that can be received and what is the greatest distance? - we need to have verifiable data. This can be PI Code, station id over the air or a definite match to a web-stream. However with regard to PI Code and RDSSpy - a single pi code in isolation can be spurious (this is warned about on the manual) but can be valid eg I've received pi code 5058 on 87.6 - Moldova Radio STIL - at 2075km on Jan 1st 2014 a 1kW station. The combination of low power and distance suggests a spurious pi code especially as it was a single 'ping'.

So if other FM-DX'ers would like to trawl through their M-S logs and analyse them - and look for the ones where you have a 100% certain station identification and there is only one transmitter on the frequency received, we can compile a list and from that show what is possible as well as what is most likely.

It would also be helpful if links could be posted to any useful articles for reference eg OH5IY's website http://www.kolumbus.fi/oh5iy/ http://www.kolumbus.fi/oh5iy/

1. At this point as far as I can summarise things - reception of M-S signals from transmitters of 5kw and under is not rare. Reception of stations at 1 kw is possible and at least one verifiable 40 watt station has been received.
2. The perceived maximum distance is "less than 2000 km"

So who is interested in helping to gather some facts to add to this fascinating subject?

From: Jim Smith G0OFE
Topic: 31305 Message: 31306

I will approach this topic by looking at the Amateur Radio aspects and my experiences, and then comparing with Band 2 FM dxing.

So far as amateur radio is concerned, the maximum distance generally achieved is around 2200-2300KM or so with MS. You need decent antennas and good elevation to get these distances. As Dave says, you can complete a contact using several pings and bursts – each station transmits alternate minutes.

During (I think) last year's Perseids, this distance was exceeded with Canaries being worked from UK, with a tropo path extension at the far end, what we call "mixed mode". We see it with TEP + Es as well on 6m.

On the one hand, powers are generally much lower (400w is the maximum allowed in the UK, with very few exceptions), but antenna systems much bigger to compensate. High speed data ("FSK441" is used) and I have decoded a ping of 70ms enough to identify a distant amateur station on 2m.

AS Dave points out, it is a lot harder on Band 2.

First you need a much longer burst, enough to (if strong enough) get a PI code or an ID, or a webstream comparison. Very difficult and I take my hat off to those who have the patience to do it. I certainly havn't!!

Second, antenna systems at the receiving end are a lot smaller, though power levels of transmitters are much higher of course.

Third, FM, particularly wide FM, is NOT a good DX mode !! SSB, CW and high speed data optimised for weak signal working are much better.

To answer the question "What is possible" – in theory, the 2200-2300km range (which is also the limit for single hop Es – the reflection heights are similar) is possible, but you need a lot in your favour (right place/right time, burst long enough, right webstream to ID with, decent antenna and good site/height) to achieve this, in my opinion.

Here below is the Finnish unofficial Top Three of B2 meteor scatter distances. I believe they all were unique transmitters on their respective frequencies?

1. Juha Ylönen, Utö, 101.7 - I: GR Parlamento, Cassano delle Murge (ba)-tx. 9.6.2013 - 2246km
2. Jouni Karjalainen, Mynämäki, 96.4 - F: France Culture Niort-tx, 17.11.2013 - 2154km
3. Markku Sollo, Tohmajärvi 89.3 - BIH: R FBih, Vlašić-tx. 6.5.2012 - 2150km

So I would definitely say that 2000 km is not the limit. Personally I've never reached that far, though.

Same has just happened to GOLD, they have nearly all morphed (AM & DAB) to SMOOTH, with a few exceptions, in areas where SMOOTH was already available on FM (due to 1990 IBA rules, no AM & FM can co-exist in same TX area). Otherwise, I'm sure GOLD would have been ditched altogether.

Both services are now owned by Global - That's Heart, Capital, Smooth & Gold - who will Global take over and ruin next?

Hi Jukka, That is a good start.

The reception of the Italian station on 101.7 is very interesting - the power listed is just 1 kw. However to confuse matters there is a station listed on 101.75 for this programme with 10kw power. It is almost the same distance away - so still likely to be 2200km+. With my receivers I would probably pick up the one offset at 101.75 without tuning away from 101.7

Myself I would think that if you can receive ES at over 2200km you should be able to receive MS at a similar distance - which why I'm interested.

WAS THE ARTICLE possibly this?
http://www.qsl.net/g3wzt/g3wzt_ms.html

I might be interested, why an MS reflection could
not briefly serve as a single Es skip? Can you tell why.

You have reported a 40W Austrian transmitter via
MS. How far away was the transmitter located?

*******Band 2 Meteor Scatter:
103.0 0715 09-01-14 AUT Hitradio Ö3, Eben (40
watts) or Ybbsitz (30 watts) Part of Ö3 jingle ID heard. Weak *****

What is the factor that prevents an MS skip
beyond 2000 km? If there is say a 40W
transmitter ....km away monitored, what is it
preventing a 100 kW transmitter 2200 km away via MS?

Possibly. I remember the rotating logo at the top of the page, but I am sure there was another more detailed page, written by somebody at a university?

> I might be interested, why an MS reflection could not briefly serve as
> a single Es skip? Can you tell why.
I don't know Ilkka. You would need to be listening at the time to be 100% certain. Note the disclaimer I have been running at the bottom of my MS page: http://www.g1vvp.co.uk/fm-log-meteor-scatter-skegness.php

The height of meteors when they burn up in our atmosphere is very similar as the height of Es clouds, so you would naturally expect the distances to be the same. FAI (Field Aligned Irregularities) is another mode related to E skip and so the distances should be about the same again, though I have often seen FAI DX reported over many thousands of km. Clearly this is not correct.

Sometimes MS bursts can sound very similar to E skip, if that's what you mean.

You would have to find the original article. It was all explained. The
key point I remember reading was that signals would taper off
dramatically above 2000 km. That article made it sounds like 2000+ km
was not really likely. The article you linked to above says that 300km
is possible. I wonder though if that includes extension modes, such as
tropo or Es.

Band 2 Scatter: 26-03-14:
89.2 1104 D NDR 2, Osnabr?ck/Schleptruper Egge (nds) News, as web 525km
89.9 1105 D NDR Kultur, Torfhaus (Harz-West) (nds) Almost noise free! 707km
94.6 1105 D MDR 1 Radio Sachsen-Anhalt, Brocken (san) End of news and ID 712km
92.1 1106 D NDR 2, Torfhaus (Harz-West) (nds) End of news and ID. Almost noise free! 707km
92.4 1109 D NDR 1 Niedersachsen, Osnabr?ck/Schleptruper Egge (nds) As web. Mixing with Linz 525km
92.4 1110 D SWR1 Rheinland-Pfalz, Linz (Rhein)/Ginsterhahner Kopf (rlp) As web. Mixing with Osnabruck 560km
99.0 1114 D HR1, Hoher Mei?ner (hes) German YL, as web. Very weak 684km
107.8 1119 D MDR Figaro, Brocken (san) Latin styled song, as web 712km
90.2 1121 D MDR JUMP, Inselsberg (th?) German OM talking, as web. Briefly on Lingen fade 739km
95.3 1131 D YOU FM (hr), Hardberg (hes) Pops, as web. V weak 712km

The FM5 is about 2m above the rooftop and is showing what is possible with average winter conditions. Nearer German scatter was much weaker today. I was amazed to hear Torfhaus on 92.1 virtually noise free when I tuned on the frequency. Koblenz and Linz were also virtually noise free. This means the FM5 is working at least as well as it used to when it was on the garden mast at the last QTH. Still no word from the planning department regarding getting the 9.2 on the roof. I have been told this could take quite some time.

Hi Ilkka, I missed this post of yours - sometimes I think Yahoo isn't showing them at the right time.

In answer to your question about ISS reflections- do I think it is a coincidence? From what you say NO - if it was me I would be jumping up and down in excitement!

Me - I would not know how much power is needed to pick up a reflection from ISS. Very little power is needed to travel 400 km through free-space and be received. ISS is a big metal object so should reflect very well - all those big solar cells.

If people do not want believe it - you've got the audio and video as proof - help them to do it for themselves. Me - I just don't have good enough aerials - and background electrical noise is too high for very weak signal reception.

David

Hi David,

THE ISS EVEN though a large object, due to its
shape is not an easy one. Its surfaces, I believe
reflect pretty much all over. Take for instance
the solar panels, you mentioned.

It is hard to comprehend, whether the ISS should
travel somewhere in the middle of the receiver and the presumed tx pinged.

METEORS AND commercial air traffic don't make
pinging the ISS any easier. It helps if there is
a phase of low MS-acticity. Also, the air traffic
above northern continental Europe is low, at
night. As to meteors, some days/nights in
February and March have been of potentially low activity.

To add to the challenge, especially from my
monitoring location, the ISS orbital track
varies. I have noticed, the ISS path runs most
regular just north of [UKR] Kiev. Unfortunately,
if I double the distance in the direction of
Kiev, there is pretty much nothing powerful
enough, to cast a signal reflected by the ISS. In
my 170 degrees, 2400 km away, there is emptiness.

And now, one must get back to the shape of the
ISS. Does it reflect a signal when it travels
close to a transmitter, or does it reflect when
it travels somewhere inbetween a transmitter and the receiver.

WELL, AT LEAST I have tried, tens of times. If not beyond a 100 times.

There are people who do a hell of a lot work, to
achieve the task. Then again, there are people
who sit on their lazy bottoms and bark at everything that moves.

One thing I am sure of is, I have reason to
believe it is possible to get a reflcetion by the
ISS. But these reflections would primarily be
rapid and faint, nothing like an MS ping or a familiar aircraft scatter.

What I have found interesting is, there have been
many occasions I have been monitoring 92.4 MHz.
And right as the ISS travels just some 100 to 300
km north of Kiev, I get a brief reflection. This
symptom I found just too regular. Then again, maybe it is just coincidental.

These are extracts from the DX Maps log database. It shows examples of the furthest meteor related loggings I could find. I looked back over the last six months. You omitted some others too which I will paste now:

28/12/13 14:05 K1SIX (FN43AD) 50.125 W9DR (EL86XV) 2022
MS MS TNX
28/12/13 10:40 EA1YV (IN52OC) 50.23 OZ1JVX (JO46FR) 2036
MS HRD WITH YO5LD 26
30/12/13 10:46 E77GS (JN84) 144.358 EI3KD (IO51VW) 2029
MS JN84<MS>IO51 FB 2024KM HNY

I could have trawled back through more loggings but it takes time to do so. I am not trying to give examples for proving or disproving anything. We all know that the unexpected can happen, but the point I suppose was that if hams could only achieve 2000 /and a bit/ km distances (i.e. under 2100 km), then what hope would we as FM band 2 DXers have for anything further? It's a case of "make of it what you will". You decide. There's nothing concrete here, but these are the facts from the DX Maps website.

The logs you quoted below also appeared when I searched for meteor scatter loggings on DX Maps, but I honestly don't know what to make of them. Were they written down as meteor scatter by mistake? Or were they genuinely meteor scatter but extended by another mode?

I am curious where you are going with this Ilkka.

>of my MS page:
><http://www.g1vvp.co.uk/fm-log-meteor-scatter-skegness.php>http://www.g1vvp.co.uk/fm-log-meteor-scatter-skegness.php

WHAT DO YOU mean by listening at the time?

I do all my MS-monitoring live, to my DXing is about monitoring live. I have the live streams right at hand, pre-sorted as I choose a frequency to monitor.

I started this empiric "online" MS- research of mine, in August 2013. I believe there is very few DXers having monitored MS live, the amount and the way I have done in past 6 months. I was to release some kind of a study on MS, but my study I believe went down the whatever, due to the shadow of doubt cast on me since last autumn.

YOUR BLOG OR your MS-page, I am sorry I do not read. Due to my professional curse, I follow the news, current affairs and documentaries. I do not follow blogs, as they are mere opinions. An opinion is like a rear-end hole, we all have one.

A FEW QUESTIONS to you, John. Just pragmatic ones. More questions, maybe later.

1) Would you say, it helps to recognize foreign languages [if one is talented in recognizing foreign languages]?

I also have problems distincting some languages around the Balkan region. I believe, a couple of months ago, your hesitation with Hungarian and Polish for instance, was just pulling some legs. Or was it?

I also had this case with MS, the bulgarian BNR. It was a good 2...3 second burst, but the one speaking uttered a longish bulgarian name. I was confused with the language. A fellow DXer of mine, passed the clip to an ex-worker of the BNR. As I recall, it was an illegal beyond 2000 km.

2) Would you say, it helps if one's ear is OK to read weak signals?

If you wish, I'll provide you with some evidence on my ears. One also may dig up the results of past Nordic DX champinshiops and check for my detail points. I took part in some 1989 to 1996, in the Finnish DX championship I won positions [1], [2] and [3] or was it 1st and two times 2nd, I do not recall any more. .

3) Would you say, it helps to monitor MS live and be aware of the current pattern, the MS-map?

4) You mentioned, you never monitored MS beyond 2000 km. What kind of antennas, at what height have you used? What kind of a mast amplifier do you have?

All my MS-monitoring is with 8-ele yagis, 10...12 metres above ground level. I cannot use a mast amplifier, as I have this 30 kW-tx in NE, just some 2 km away.

Back in the 80's, I did this comparision between 8-ele yagis Funke [german], Visi [italian], VKN [finnish], right at home. I noticed, the VKN beat the breakfast out of the two others. That very same VKN still is my primary.

******'I took part in some 1989 to 1996, in the Finnish DX championship I won positions [1], [2] and [3] or was it 1st and two times 2nd, I do not recall any more.*****

1989 to 1996, I took part four times. One of those, was a bummer as I could DX just one or was it two days of the contest, the contest starting Friday afternoon and ending Sunday, early night.

I am sure you are right - it a reflection from ISS.

You wrote: "It is hard to comprehend, whether the ISS should travel somewhere in the middle of the receiver and the presumed tx pinged."
As ISS is a lot of metal the signal could bounce back towards you? - like sunlight from a mirror. Because ISS has an irregular shape (epäsäännöllinen muoto - Google translate) reflections could go in different directions.

Some nice propagation during late morning to this lunchtime. Has quietened down for the moment. On the 39 MHz range, had what sounded like Iran on a few frequencies, not sure but I am presuming since it sounds similar to what I caught last time. Also 33875 kHz presumed Russian, & a couple of others which I forgot but I have recorded. Hopefully more during the day.

sleeper77, Southampton.

That's the preferred way. Live listening provides more fun. With meteor
scatter I have recorded web streams. That is not 'instant' as listening
in a live situation. As I probably said, my use of web streams will
probably be frowned upon by some, but I am satisfied that I have taken
sufficient care to prove that my loggings are 100% correct, whether I
heard an ID live, recorded an identification or synchronised a recording
of a web stream at a later time to confirm any reception. Meteor
scatter, for instance. I will get that video finished soon.

Who has cast the shadows of doubt? I have not. I think it is commendable
to have studied lots of data in order to make a full case study. Please
share if you wish.

Nothing wrong with that. I only started my blog to keep a record for my
own use. Same as my website. It seems to be widely read though -
something I never expected. It is a personal account of things and no

doubt not to everybody's taste.

I don't remember the exact detail. I don't pull legs for the fun of it,
definitely not. I am not a practical joker, that's something I have
always frowned upon.

This is a good question. Some people have problems with their hearing
and need more help than others. They might not hear weak and noisy
signals very easily. If members are unsure they could post their
recordings here for assistance. The replies may differ in opinion
though, depending on the recording at hand.

That's fine if you wish to. From what I recall, nobody was disputing any
of your loggings here.
>
> 3) Would you say, it helps to monitor MS live and be aware of the

I never look at the meteor charts, but I suspect it would probably help
some DXers. Particularly if the direction of the entry point of the
meteors is known, etc.
>
> 4) You mentioned, you never monitored MS beyond 2000 km. What kind of

I have personally never received meteor scatter at 2000km. I know it is
possible and I wouldn't strongly dispute that another hundred or two km
further might be possible. But I can only go by what I have read on the

statistical data of sites like DX Maps. There does seem to be fairly overwhelming evidence that anything above 2000 km is going to be difficult, though not impossible.

I have only used a Triax FM5 and a Korner 9.2 in recent years, never more than 7 or 8 metres above the ground.

31348. 2014 Sporadic-E (ES) - when will it start?

Yahoo group: SkywavesDX (2014)
Date: 2014-03-30 14:49:52 UTC
From: <davebunyan@...>
Topic: 31348 Message: 31348

This is just for information - data extracted manually from FMList Visual log to find out when the Sporadic season started in previous years This is not definitive - only as reported in FM List - and only European entries were found.
2008 - small openings on 3rd May (I to E) and 13th May NI to I) - big opening on May 22nd
2009 - small openings on 4th May (D to I), openings on 10th and 16th May
2010 - small opening on May 2nd and 3rd, major openings on 11th and 12th
2011 - opening on May 1st, major opening on May 3rd, opening on May 7th, major opening May 9th
2012 - major opening on 29th and 30th April 2013 - openings on 26th, 27th, 29th and 30th April.

What will be interesting is whether the 2014 season starts before the end of April and whether the openings have come earlier each year because the sunspot numbers are getting higher.

I'll certainly be monitoring intensely from mid-April onwards.

I consider the season to start from 1 April and go through to 31 August however I am mainly focused on 50 Mhz. Having said that it is unusual to have any meaningful openings until much nearer May, and August is very sporadic (sic). June/July is the peak as we all know.

2009 - small openings on 4th May (D to I), openings on 10th and 16th May

2010 - small opening on May 2nd and 3rd, major openings on 11th and 12th

2011 - opening on May 1st, major opening on May 3rd, opening on May 7th, major opening May 9th

2012 - major opening on 29th and 30th April

2013 - openings on 26th, 27th, 29th and 30th April.

What will be interesting is whether the 2014 season starts before the end of April and whether the openings have come earlier each year because the sunspot numbers are getting higher.

I'll certainly be monitoring intensely from mid-April onwards.

Subject: [SkywavesDX] 2014 Sporadic-E (ES) - when will it start?

This is just for information - data extracted manually from FMList Visual log to find out when the Sporadic season started in previous years
This is not definitive - only as reported in FM List - and only European entries were found.
2008 - small openings on 3rd May (I to E) and 13th May NI to I) - big opening on May 22nd
2009 - small openings on 4th May (D to I), openings on 10th and 16th May
2010 - small opening on May 2nd and 3rd, major openings on 11th and 12th
2011 - opening on May 1st, major opening on May 3rd, opening on May 7th, major opening May 9th
2012 - major opening on 29th and 30th April
2013 - openings on 26th, 27th, 29th and 30th April.

What will be interesting is whether the 2014 season starts before the end of April and whether the openings have come earlier each year because the sunspot numbers are getting higher.

From what I remember over the past two years is by mid-May there should definitely be an opening. The earliest I can remember is probably 8th or 9th of May to Spain & north Africa about a year or two ago. I can also remember about another year or two ago is that there were weak random signals in very early May from Italy, but no proper opening until the middle of the month. So even if there are no openings at the beginning of May, there should be a few signals floating about.

31356. Re: 31.02 Unid US Police

Yahoo group: SkywavesDX (2014)
Date: 2014-03-30 18:45:38 UTC
From: Mark Cobbeldick, KB4CVN
Topic: 31327 Message: 31356

I had posted this over on Ian's VHF-Skip group, and repost it here for the other readers:

31.020 MHz in North Carolina was licensed statewide to the State of North Carolina Forestry with callsign: KA9939. This license expired back in 2012.

http://wireless2.fcc.gov/UlsApp/UlsSearch/license.jsp?licKey=1240964

The state retained other licenses on 31 MHz for the same agency. In wonder if 31.020 was part of a common frequency plan loaded into every radio, and the users are unknowing still using this frequency?

ADDITIONAL:
I listed to the .MP3 file. To me, it definitely sounds like common North Carolina Highway Patrol (NCHP) format of radio traffic. North Carolina Forestry has mostly migrated to 150-174 MHz. I wonder if NCHP has started using some of Forestry's former frequency allocations? A bit odd, but not inconceivable.

Thanks to all for replying. Yes, MS would make sense. The longer paths (Europe - USA) are still a questionmark though. And when looking at the maps now, it is even crazier with Hawaï making it into Europe. On CW so it seems! Shown as shortpath, but in reality I would expect this to be longpath at this time of day.
Interesting!

Hi Aleksandr, there is maybe more than one language in your videos?
In the first embedded video v=JzHz6U28i1U it sounds to me like a Slavic language
In the 2nd v=P4bho_rxFNo there is a good ID announcement at 0:09 and 0:16 which someone will recognise
The 3rd v=iHDDPm3ZpPk sounds a bit Turkish but I don't know
The 4th v=1YrTHfMP534 sounds to me much more like an 'Indian' language

In the UK, a 'strange language' on 96.8 usually means Welsh, but not in Ukraine :-)
Maybe someone here can help
- Julian

Hi,

It would be helpful if you mentioned, what kind
of antenna you were using and which direction the antenna was pointing.

I listened just briefly, on the laptop speakers.
To me, the id [or programme title] in the first clip sounds like Nashe Radio.

Could it be a new transmitter site or a new frequency by Nashe Radio?
Or the Kiovan station/trasmitter [DJ-FM] on 96.8,
leasing transmitting hours for others?

Anyway, based on multilingual programming, I
guess it is a "big network". Without knowing
about the antenna you used, I only guess the
transmitter is within some 300-400 km radius.

Sorry, I could not help any better.

73, ilkka

This is not Romanian... More than sure of this.
To me, doesnt sound like Hungarian either....
THere is a mention of 'radiosy' at the end of first recording, probably
meaning this may be some sort of a Turkic language but not Turkish as
such...

From: Kurt Zscherp
Topic: 31388 Message: 31400

Hi Aleksandr,
you sent 3 recordings of 96.8 to me. None of them is turkish or similar.
The longest one (26032014124.mp4) is quite sure Hindi or Urdu.
The language in the second recording (26032014139.mp4) sounds different.
The third one (26032014140.mp4) seems to be a farsi type language like
Pushto or Dari.
Maybe somebody knows somebody, who speaks these languages.

Dear friends! Thanks for your answers.
The video is really very interesting fact far receiving FM stations.
Used antenna vertical half-wave dipole 88-108 MHz, it placed at a height of nearly 15 -16 meters from the ground.
I'd like to solve the riddle of the receiving station.

106.7 493km

** Personal Skegness 'First' via the respective mode

Briefly, there were some complications regarding the installation of the 9.2 a few days ago, hence me now having to use a very well hidden FM5 at only one metre above the ground. This is pinned in a south-easterly direction between trees and the wall of the bungalow.

The scatter log above includes everything I heard via this mode yesterday using a one metre high FM5 and two brief listening sessions. I am hoping the 9.2 will be installed in the near future as permission has now been granted, following an inspection by the planning department, but I am still having to wait for this to come through in writing.

Good DX!

I was just thinking about this. It is a while since I configured RDS Spy. I now use the GTK software with my XDR-F1HD.

How have you got the audio set up? I was wondering if you have the clock and data signals separated to different channels? i.e. one to the left stereo channel, the other to the right?

It doesn't matter which side these are connected to, though you may have to switch the channels in the RDS Spy settings.

Thanks Alex.

I heard veronica with an echo of itself on 103.0. I then noticed in FM List that there is a new transmitter planned for 103.0. I checked 103.1 to see if another Veronica tx was coming in and producing the echo from there, bleeding over to 103.0, but 103.1 was empty, unless it was there and had quickly faded. It all happened too quickly, but there was definitely an echo.

Another "one metre high DX session"! Maybe I should class this as an ultralight log? It was quite a rapid-fire session though with lots of Dutch stations coming up very suddenly on aircraft scatter, some leaping out well above the noise. I have noticed a scatter good peak around this time before.

Good DX!

Thanks for this Ruud. Perhaps so, or maybe there was a much briefer
burst from a tx on 103.1, splattering on to 103.0, which had faded when
I checked the frequency. Sometimes scatter can be very brief.

Good DX!

From: Chris Thatcher
Topic: 31416 Message: 31424

Correct me if I'm wrong, but the sound card you have looks to have only digital inputs (coaxial and optical).
My understanding is that RDS Spy needs analogue (left & right) inputs, (one channel for clock, the other channel for data).
The above would not be achievable with digital-only inputs.
It looks like your sound card has only analogue outputs, but does not have analogue inputs, so it will not work with RDS Spy.

You will need to speak to other members of this group, who will tell you what pin numbers to use on the RDS chip contained in your tuner (if it has an RDS chip).

Beat regards,

Chris (2E0NDT)

31425. strange mixing product

Dear all,
I've read of this happening on MW but never personally experienced it.

this morning around 11:00 during heavy rain i noticed a weak mixing product on 87.5 carrying the audio of BBC Radio 2 & 3 (and possibly more), it was audible on both receivers but only on Vertical polarisation and only when beaming 315 degrees

when the rain stopped the signal vanished!

so theres some metal structure 315 degrees from here radiating a mixing product when it rains!

Tim - That is an intriguing observation that might be explained by high field strengths at Jodrell Bank focus point. The Lovell telescope is an impressive structure with a capture area of 4500m? at an average height of 55m so if it were beaming close to the horizon in the direction of a high power broadcast transmitter it is quite realistic to suppose that intermodulation could occur at a corrosion point in the metalwork close to the focus. It is rather too much to presume that you might be in exactly the same direction from the telescope, but you might nevertheless receive a weak signal from this mixing product off-beam.

The telescope beamwidth will be very narrow so it is most likely that any IPs would be produced from one and the same transmitter and the only contender for those frequencies is Tacolneston! Its bearing from Jodrell is roughly 120?, distance about 220km while you lie at about 140?. I don't know if this is possible but it makes you wonder exactly where Jodrell was beaming this morning!

- Julian

** Personal Skegness 'First' via MS

95.5 was interesting overnight in that the overwhelming majority of pings and bursts were from SR3, Gottelborner Hohe. Of the few which were not SR3 (four or five pings) they were from a mystery classical music station and one I did not record. Other transmitters started to come in after 0600, France Musique being the most consistent, very likely the Clermont Ferrand transmitter.

All general scatter was received with the FM5 horizontal. I re-positioned this vertically during the afternoon but it killed off all the scatter, with the exception of Langenberg. Back in horizontal again and the Dutch scatter returned. When my one metre high FM3 and FM5 were vertical at the last QTH I noticed the same lack of scatter. Vertical really does not work well on band 2 when low down.

Good DX!

31435. Ofcom are not fit for purpose

Yahoo group: SkywavesDX (2014)
Date: 2014-04-06 18:48:39 UTC
From: nick gilly
Topic: 31435 Message: 31435

Hi all.

This is something which I have been thinking about sending to the group for a while now. It's depressing but necessary I think to warn others of the pitfalls of trying to get interference eliminated. From my dealings with Ofcom, it seems that they are either seriously incompetent, or possibly even corrupt. So here goes (warning - long email ahead):

On January 8th this year I started to get some regular QRM which would usually be on most evenings and go on for hours on end. The noise takes the form of a rasping buzz and is enough to disrupt reception from Rowridge to a point where the hiss levels are too high. After wondering around with a portable tuned to an empty channel on the bottom of MW I found a spot where what appeared to be the same noise peaked outside a couple of back-to-back properties about 50-100 yards away. I also had the aerial checked by a local installer and he couldn't find anything obviously wrong.

At this point I will post 3 links to demonstrate the interference:

https://app.box.com/s/wzy0qapjbxvfbko2tqbb - this is tuned to 87.7, an empty channel at the bottom of the band

https://app.box.com/s/z2zhe04w4ho3vxsp53a0 - demonstrates the level of hiss on Radio 3 from Rowridge as well as tuning to the sidebands where the noise can be heard clearly

https://app.box.com/s/jkmkfajgijzfhxg7w40w - this is Radio 3 from Rowridge when the QRM is off. The hiss is a lot less intrusive

I contacted the BBC about it and after a lot of to-ing and fro-ing with both the BBC and Ofcom I managed to get an Ofcom engineer over to visit on Friday 28th March. I didn't mention anything about my DX interests other than the fact that I had the aerial pointing east to receive a couple of London stations as I know that Ofcom don't follow up on complaints to disruption to out-of-area signals. During this time the noise was present on the band. I used a Yamaha tuner with analogue tuning to demonstrate the noise as well as showing him a noise diary I had been compiling for the previous couple of weeks and playing him a couple of the above clips. He set up his equipment and connected it to my aerial, and had a tune around. I remarked to him that I could hear the noise on his equipment and he immediately dismissed me by saying that it was because he was tuning around and that there was no interference! I should also mention that the equipment he was using looked very basic. There was no spectrum analyser display or waterfall on a screen, just a large analogue meter to read signal levels and an LCD display to show the frequency to the nearest 10 kHz. It looked like a pretty conventional tuner, in other words.

We went out to the spot where I found the peak of the noise before but I couldn't hear it on the portable this time. He told me that it was not instructive to search for the source on AM due to the many different noise sources that can be picked up. He has a point but AM seemed to work the first time I tried. This may complicate matters.

In the end he said that my problem was not interference but insufficient signal strength and that it wouldn't be fair to complain about interference when my aerial is not pointing to the local BBC tx (Rowridge) and so my aerial would need re-positioning. This seems logical, but the thing that really bugs me about his visit was his total refusal to acknowledge that I had any interference on the band at all thus inferring it was all my imagination. I pointed out that my other tuner has a bar lit up on empty channels when the QRM is present but he dismissed this saying that it was meaningless. You only need to hear the clips to see that there is something going on. It is possible that beaming south would reduce the impact of the noise a lot, unless, of course it is coming from that direction. It will still impact DXing when it is present.

I then sent a complaint to Graham Howell at Ofcom on April 1st saying that the man who was sent did not appear to be a properly-qualified engineer as he didn't seem to recognise interference when he heard it, the equipment used did not appear to be up-to-scratch, asked about his qualifications and the validity and calibrations done on the equipment and pointed out that I couldn't see how his conclusions could be fair & impartial (a requirement of Ofcom) if he couldn't even recognise when interference was present!

After some Googling and corresponding with a radio amateur who has suffered at the hands of Ofcom even more than I have, I then found out that the man who came to visit me was not even an engineer, but the Area Manager for SW England and Wales who does not have a technical background. Why did they send him when it could have been a simple case for a properly-qualified RF engineer with the correct equipment? (No wonder his "tuner" looked so basic. He probably hasn't been trained to use a proper spectrum analyser.) Was it just to fob me off and get me off their backs as quickly as possible?

Then, on 3rd April I got the following email from Ofcom:

"Dear Mr Gilly,

INTERFERENCE INVESTIGATION

I am writing to advise you of the outcome of our investigation into your interference problem.

Your signal field strength for VHF Band 2 reception is lower than it should be for reliable Stereo reception. We advise that your external aerial is re-aligned towards the service transmitter for your area - Rowridge on the isle of Wight. No external spectrum interference was detected by our engineer. (bold is my emphasis)

Our investigation is complete and case reference 1-254278862 is now closed.

If you experience any further interference problems, you will need to request a new investigation.

Yours sincerely,

Duty Engineering Officer

OFFICE OF COMMUNICATIONS"

So there are two lies in that highlighted sentence:(a): that I was visited by an engineer, and (b) that no interference was detected. Something else occurs to me about this whole fiasco: Ofcom have a disclaimer which says that if they find that a source of interference is from within your own home or that your equipment is at fault, then they charge something like £90 per hour for the callout/investigation. The man who visited me basically said that because my aerial is incorrectly aligned, then my equipment is at fault. So why wasn't I charged for the callout?

It really is a shocking performance from a regulator that is supposed to protect the RF spectrum from interference and which is partly funded by us, the taxpayer. Value for money? I don't think so!

Ofcom have so far failed to follow their own standards and procedures on this case, and so I suppose technically, they are in breach of duty. It really does seem that they do not care at all about interference to analogue radio, and it has been suggested to me that it is all part of the "Digital Britain" plan which includes releasing spectrum for faster rollout of "super-fast" broadband. I think the only way out of this mess is to have Ofcom disbanded completely and replaced with a regulator with teeth! I'd be very interested to know from Skywaves members overseas what their communications regulator is like when dealing with interference complaints. Surely they can't be as bad as Ofcom?!

I am planning to upgrade the aerial system here soon, in time for the Es season, replacing the FM5 with a Körner 9.2, adding a Yaesu G-450 rotator, better-quality coax and raising the height by another 8 feet or so. I *hope* this minimises the impact of the QRM to a manageable level.

So, there you have it. It really does seem that we are all on borrowed time regarding noise and QRM on the band, because, at least whilst Ofcom are in charge, the chances of a resolution to the problem seems slim.

Good DX (soon, hopefully)

Nick, Whitchurch, Hampshire.

Yamaha T-2, Denon TU-800L, Kenwood KT-1100SD (modified), Yamaha T-85, Sony XDR-F1HD tuners, Triax FM5 horizontal beaming east.

From: Paul Logan
Topic: 31435 Message: 31436

Hi Nick,

depressing but not a very shocking tale.

I have to say that when I had some bad interference to MW a few years back the guy who arrived from Ofcom was obviously well trained, well equipped and talked with me at length about receivers antennas etc. He was driving a vehicle which was a dxer's dream kitted out with all the toys and aerials we all love.

However, in that case since the interference was not wiping out a local FM signal there was nothing he could do.

Since then things have got worse. Medium wave is a lost cause for me, FM often suffers and even Low VHF is getting hammered at times.

The problem lies further up the food chain where there seems to be little real regulation of the import and sale of devices which flood the rf spectrum with crud.

Its really depressing. Government simply dont care.

"It really does seem that we are all on borrowed time regarding noise and
QRM on the band"

Nail on head.

Paul

Topic: 31439 Message: 31440

Dave - I have never seen a 3500mAh AA size rechargeable, this is a common capacity for C Size though the more common C's are 2200mAh which are really AA types in a C size case, beware! and 2850mAh seems to be the highest AA capacity.
I bought a few rechargables recently, starting with searches on Maplin - 'wow that's expensive' so I tried eBay - 'wow they're all as dear' but
http://www.batteriesplus.co.uk/acatalog/Batteries_Plus_Domestic_Batteries_1.html
http://www.batteriesplus.co.uk/acatalog/Batteries_Plus_Domestic_Batteries_1.html are sensible prices and a specialist dealer - recommended

I have these: Sony CycleEnergy Green LR6 AA NiMH NHAAB4F 2700 mAh. Tested
as the very best last year by Finnish World of Technology magazine.

Julian oh well I bought some 3800 mAh ones a few years ago but now don't really hold a charge and I guess were nowhere near the stated capacity, I hope offcially there are ones available now which are at least around the 3000 mAh ones anyway !

Such LR6 2700 mAh were on sale here in France (under Carrefour
supermarkets logo) for some years. I used 8 of them and they worked
very well but surprisingly they disappeared from the Carrefour
supermarkets a few months ago. They are now replaced by new 2500 mAh
Carrefour batteries
I never got anys serious explanation from Carrefour about this recent
change.

7dayshop's own brand batteries are very good. I have brought several, they are high capacity as stated, they do last, however the issue with battery tech is the same irrespective of the chemistry, the life of the cell is very much depending upon how (and when) you charge them and how you use them.

I strongly recommend using there Delta-Z charger. The name is meaningless really, the charger just ensures each cell is charged correctly.

In my earlier experience the higher the capacity of a rechargeable NimH the faster they when flat when not in use. So when I went to use my camera after it had been in the drawer for a while the batteries were flat.

However Sanyo have brought out a hybrid battery under the brand name Eneloop and these are much better at holding their charge. The 3rd generation AA batteries offer a minimum of 1900maH, up to 1880 recharge cycles and retain 70% power after 5 years. You might find these are more effective than high capacity standard NimH batteries which lose their charge quite quickly. They do need to go through 2 or 3 full charge/discharge cycles to achieve their full capacity. I certainly have found them far superior to the standard re-chargeables.

Sanyo are vastly more advanced in their production of HiMh cells, at the moment at least. The technology and production techniques are improving so much that they may not have the lead for much longer. Son't think it will be the likes of Duracell or Energiser who will be in the lead any time soon though. Those two are surviving the market by being a market leader and artificially high prices.

Band 2 Meteor Scatter: 07-04-14:
97.5 0012 AUT ?1, Linz 1/Lichtenberg (obe) Classical music, as web
1111km **
97.5 0038 D SWR3, Bornberg (rlp) German OM over song, as web 640km **
97.5 0452 DNK DR P4, N?stved - ?verup/K?gevej 291 (sjl) Simply Red
song, as web 782km **
97.5 0748 D MDR Info, Suhl/Erlesh?gel (th?) German OM talk, as web
768km **

** Personal Skegness 'First' by the respective mode

97.5 was tonight's chosen frequency. There was a big increase in the number of MS pings too. Unsurprisingly, regular bursters were ?1 from Linz (100kW) and SWR3 from Bornberg (25kW), often appearing together in the same burst! Next to that, 5kW MDR Info from Suhl was also quite regular.

There were quite a few bursts from unidentified German language stations which I hadn't recorded. I can only presume that they were low powered Austrian or Swiss transmitters. Germany, Switzerland and Austria has become of particular interest lately and I endeavour to record all German language streams to be certain I am logging the correct station, but all Swiss station's web streams simultaneously dropped out after only eight minutes of recording on this occasion - at precisely 00:13:35 GMT in fact. I also tend not to record the stations with flea powered transmitters, i.e. 50 watts or less. Perhaps I should.

Hello Nick

A casual inspection of this form (Adobe Reader PDF file) will give you an idea about how ACMA in Australia approach this issue!

http://tinyurl.com/mu6jkl6

Note one of the following conditions:

Fortuitous reception—if you are receiving fortuitous radio signals not planned to serve your area are far more likely to experience reception difficulties due to the unreliable nature of weaker and distant digital signals. The ACMA do not investigate interference to fortuitous reception.

In my personal experience, the onus seems to be on us to solve (or minimize) the interference because its a niche hobby. Whilst the experience of interference exacerbates an already difficult hobby, I have learnt so much through troubleshooting interference so perhaps that's one positive outcome.

As it happens, I now have new neighbours & my interference at home has risen on lower FM frequencies. Eventually their lease will expire, can't do anything about that.

Also I now have two localized FM transmitters (car or domestic FM modulators) totally blocking out my empty channels on 88.2 & 90.0 MHz. These can't be nulled; one is full strength quieting stereo on the Yamaha meter. Awesome! Thanks, China for producing low-cost radio equipment that complies with Australian federal legislation!

I'm confident the new antenna will improve the interference for you, Nick. Without question, installing a second smaller antenna (5-el) made things more pleasurable for me. Without changing anything, introducing the NEIM 1031 for voice-only signals made dealing with the interference manageable.

The bottom line for me is that going mobile in the car solves all of my interference problems. It's sometimes incredibly inconvenient to have to do that, but spending money on the best antennas (that suit the car), a pre-amplifier & receiver in the car has been invariably worthwhile. A mobile approach only really suits tropo signals of course. Also, newer cars seem to have limited upgrade potential.

Finally, sorry to hear about the time wasting of the Ofcom call out. But at least you have ticked off one of the solutions now.

Cheers
RLD

Where does amateur radio sit with this problem today?

If there is interference to an amateur band, are ofcom more likely to carry out a thorough investigation, or are they not interested in that anymore?

They do less, only interested if you are the paid up member of the old boys club. Really it a case of, I am a big industry and my customers are affected and then OFCOM might do something about it, but this can be anything from a strongly worded letter to a visit from a man claiming to have qualifications using a slightly fancy radio to DF the source, and then do not a lot about it.

That is such a shame Dennis.

As you may remember, I had some experience of ofcom at the end of last year with my own interference issues. They were only concerned if the interference was to a local broadcast FM station. I don't remember much about their comments on the amateur radio side, but I remember there was a lack of concern. They told me that amateur band frequencies should be protected anyway, brushing it aside. They did seem sympathetic though and had very high-tech looking spectrum analysers. One was a new model and one was an older type, which they said was better in some way.

Of the four people who visited (four different occasions), three of them were radio hams or were taking their exams shortly. I remember them saying they weren't sure who they were working for at that time. They didn't know who had overall control of their jobs and said this changed on a regular basis. They did not go into detail.

ofcom really need to be present when the interference is there and we know that isn't always going to happen. As a stroke of misfortune for me, it wasn't there on three of the occasions when they visited me, but it was on the fourth. They could see and hear the noise but said it wasn't of a high enough level to threaten local radio reception (which it wasn't at the time, but had been). They drove up and down the street and nearby area to try to locate the noise source but couldn't. They could only hear it on my aerial but said it was not strong enough to take any further action.

I occasionally drive past the end of my old street and have the car radio on, checking presets as I drive past. Band 2 reception is now virtually obliterated by what sounds like a strong blank carrier on many frequencies, indicating that the problem has worsened. There is a green BT connection box at that point on the end of the street. Maybe that has something to do with it.

John

Everyone interested in M-S reception knows when the main showers are but I came across this entry on the 2014 calender on www.seasky.org http://www.seasky.org :
"May 24 - Possible Meteor Storm. In the early morning hours of Saturday, May 24, the Earth will pass through the debris field left behind by a small comet known as P/209 LINEAR. Astronomers are predicting that this interaction may result in a brief but intense burst of meteor activity that could range from dozens to hundreds of meteors per hour. Nothing is certain, but many mathematical models are predicting that this could be the most intense meteor shower in more than a decade".

And just as a reminder - as the days go past so quick. Lyrids shower is 16 to 25 April peaking in 22nd/23rd. Followed by the Eta Aquarids late April - mid May, peaking on 5th/6th.

I suppose, it might be somewhat difficult for astronomers to predict
the exact time of the P/209 LINEAR debris field. Then again, I do not
know of the methods astronomers have in their use.

In the past, this very concentration has been referred to, on various sites:
http://www.imo.net/calendar

Now that the Es season is arriving, M-S also gets more challenging to
recognize. Then again, there might be the chance for Es and M-S skips
combined, as well as the tropo extension.

Thanks for the info Dave. I was not aware of this.

I don't usually follow the meteor calendars/times, etc.

Regarding the accuracy in predictions, I believe they can still be out by a day either side.

John

This is actually a 'new' event - lets hope the it lives up to the predictions as the comet itself has been happily orbiting the solar system every 5 years or so for centuries - but the calculations indicated the earth is likely to cross the path of a number previous orbits. May not be a meteor 'storm' and lets hope we don't have a major ES opening at the same time!

Further info from the Web - peak is being predicted at 0721 UTC on the 24th May - the source is from the Camelopardalis constellation - which is above the horizon for the whole 24 hours. Moon is not visible so provided the night of the 23/24th is clear there every possibility of a good visual and radio display.

Meteor Notes:
* Lots of bursts tonight.
* SRo 1 Radio Slovensko was the most regular burster.
* There were lots of interesting Slavic languages here.
* I recorded a 28 streams in total, which I think is more than I have
ever done simultaneously.
It was a bad night for web streams switching off however. About eight
to ten of them did so.

Other than that, I moved the FM5 to the opposite side of the bungalow
this evening, at the most northerly corner, trying it one metre above
the ground and then at five metres. It made very little difference to
reception as that side of the garden is more 'open' and has slightly
more distance between us and the nearest property. It also has a better

take-off across the middle of some long gardens gardens between neighbouring streets.

What I also noticed is that there is a reduction in the noise I get to the south and this has almost gone now. I am tempted to install the 9.2 on this side of the bungalow, but I think it would be more out of the way where I had originally planned - on the south-west side. I still don't have the necessary written permission to install this yet, but I have been assured it will be with me next week. We'll see!

Good DX!

The current solar cycle is an unusual one. One an a half year ago we had a maximum, which is now called the northern hemisphere maximum. In February 2014 we saw a new, somewhat higher maximum, which could become the southern hemisphere maximum.
However, when looking at the active region distribution of today, the northern hemisphere is by far the most active.
Anyhow, the predictions are that the southern hemisphere maximum is time shifted, which supports the forecast that activity will remain elevated for another year.

I've turned all the NASA sunspot data published in their web-site into Excel charts (1752 to date!) and this cycle it is still going to be the lowest since the 1936-38 peak - the only time the count has been above 100 was Feb 2014 (so far). It may even be poorer than the 1926-1928 peak. Not only that, but there was an unusually long quiet period preceding this cycle. And if we are heading into another Maunder minimum period.....

Oh well let's hope for a good SpE season.

Hi David,

This very latest pass, just some 20 minutes ago, was most ideal.

There was virtually no M-S around. I got two vague reflections, during the 4 to 5 minutes while the ISS passed by, close enough. I believe, you have done hundreds or thousands of hours live M-S monitoring like I have done, and you know what I am writing about.

I believe, you guys have also tried, as you live right underneath the ISS orbital path.

Plausible, I would state.

Hi Ilkka,

No sound clip attached - but one you sent me some time back for an ISS reflection also appeared to be a plausible reflection. It was the one where the signal appeared for a few moments with rapid flutter - but NOT like aircraft scatter. And it was the same strength so nothing like MS.

Hi Andy thanks for getting back us, sorry for the delay on replying here. I've put up with this radio ever since installed it. No no Sharx..:-(The RDS signal level required to ID is quite low so better for DX than the OEM Clarion radio.

However I have just replaced it with a new Pioneer DEH-X6650BT. Initial FM performance seems good. It is sensitive and seems selective. But how it compares to a sharx radio I don't know...?

Hi again!

I forgot to mention signals from low earth orbit will exhibit polarisation fading which is slow fading up and down over the course of a few minutes throughout the pass. This is because you are using a vertical or horizontally polarised antenna. It can be reduced by using a mixed polarisation antenna. The same will apply to signals reflected off the ISS.

Regards,

Mike.

Going down the route of using OFCOM, while futile in the immediate short term, could be beneficial if everyone still persisted. Doing so makes up stat's and provides more elbow to protest with.

Hello all,

I had to root my Gotab 6 Android tablet in order to get these apps working. Fortunately someone had produced a guide how to do this on my exact model.

Wavesink Trial works fine, but as you can see, or not see, the typeface is rather small. It has RDS, but usage is only 5 minutes without re-booting so not really suitable for SPE :)
The full version "Wavesink Plus" has the same size writing and I don't think the bandwidth can be changed.
http://s1132.photobucket.com/user/pe1etr/media/Video0012.mp4.html
http://s1132.photobucket.com/user/pe1etr/media/Video0012.mp4.html

SDR Touch has no RDS and crashes every time I tune or change something, but I found a work-around. Bandwidths and frequency can be changed using the touch screen, but it doesn't seem to like my tablet.
http://s1132.photobucket.com/user/pe1etr/media/Video0014.mp4.html
http://s1132.photobucket.com/user/pe1etr/media/Video0014.mp4.html

** Personal Skegness 'First' via MS

I had decided to let the XDR rest for a few nights so it was bright and fresh for the April Lyrids. Then I realised that meteor activity was quite active just before midnight last night, so I decided to tackle 100.2. Bursts were much more frequent than on previous nights, though things did taper off a bit towards dawn. I guess the earlier increase might be related to the Lyrid meteor shower, which is due to peak over the next week or so.

All MS stations logged above were heard numerous times.

Daytime scatter was good with Bielefeld coming in with the best signal I have had here this year, yet the FM5 is still only 1 metre above the ground.

More info on the Lyrids, taken from the AMS Meteors page:
http://www.amsmeteors.org/meteor-showers/meteor-shower-calendar

Lyrids: Active from April 16th to 25th 2014.

The Lyrids are a medium strength shower that usually produces good rates for three nights centered on the maximum. These meteors also usually lack persistent trains but can produce fireballs. These meteors are best seen from the northern hemisphere where the radiant is high in the sky at dawn. Activity from this shower can be seen from the southern hemisphere, but at a lower rate.

Radiant: 18:04 +34? - ZHR: - Velocity: 30 miles/sec (medium - 48.4km/sec) - Parent Object: C/1861 G1 (Thatcher)

For some of the earlier European-only high-end Pioneer models from 2005, such as the DEH-P55BT Pioneer Electronics quoted an 80 decibel 200 kHz selectivity figure in their handbook specifications.

I have three older Sharx receivers here & one new one in the car (Las Vegas DVD35) so I'm doubtful anything will beat their selectivity - but would love to be proven wrong! I'm still interested (hmmm... obsessed?) in how the more modern DSP receivers are progressing so these observations are always interesting to read.

The ability of Sharx to decode weak RDS signals surpasses any conventional tuner I've ever owned & even the Elad SDR with SW2. (These observations are of course 'out-of-the-box' comparisons without RDS Spy or the Sony XDR-F1HD modification).

Good DX!

I believe you Peter, as I've never used one. Only in recent years did Pioneer (or even JVC) begin to release RDS-enabled models to the relatively small Australian market. Basically Pioneer gave us the East Asian models as used in India & Malaysia.

RDS-enabled radios made by Sony & Blaupunkt have been available for a while in Australia though. My observations about Sharx & the speed of RDS PS decodes was however mainly in reference to conventional component tuners, although when you add in RDS Spy it's a whole different ball game. Speaking of which, my next challenge is configure RDS Spy with the Elad SDR for reportedly superior performance. In a few tests last year, RDS Spy with two component tuners here gave similar speed PS decodes as Sharx but that's a fairly meaningless comparison test because PS decodes aren't what we crave anyway.

Good DX!
RLD

---In SkywavesDX@yahoogroups.co.uk, <pe1etr@live.com> wrote :

"The ability of Sharx to decode weak RDS signals surpasses any conventional tuner I've ever owned & even the Elad SDR with SW2. (These observations are of course 'out-of-the-box' comparisons without RDS Spy or the Sony XDR-F1HD modification)."

Really? Not tried a Pioneer car stereo with RDS? Pioneer DEH-4700MP (D4Q) RDS speed test.

http://youtu.be/-Gms9UyJ5Rg http://youtu.be/-Gms9UyJ5Rg

I found my Blaupunkt SHARX model very slow at decoding RDS.

Band 2 Meteor Scatter: 14-04-14:
100.7 0117 LUX Radio 100,7, Dudelange/Ginsterberg (gld) Classical, as web 573km **
100.7 0147 D Sputnik (MDR), Kl?tze (san) Sam Smith song, as web 732km **
100.7 0519 D WDR 4, Ederkopf (nrw) Beatles Tickt To Ride, as web 592km **
100.7 0614 D Deutschlandradio Kultur, Meppen (1kW) or Freiberg Niedersch?na (320W) German lady on the phone, as web **

** Personal Skegness 'First' via MS

An interesting meteor session with Dudelange producing the most prominent pings. Klotze was also quite frequent. There were several classical stations too but there were salso networked night services to contend with so not all could be identified. Notably MDR Figaro had the same programming as BR Klassik, and SRF2 Kultur had the same programming as Radio Rumantsch. WDR4 and SWR4 also shared a common service, the same for Sveriges P4 regionals Gavleborg & Blekinge - I definitely heard one of these, but which one?

Good DX!

RLD

I've had three Pioneer models, from 2001, 2007 and 2010. They all had much faster RDS than the one Blaupunkt model I had. I found the RDS performance of the Casablanca disappointing. the selectivity was much better than the Pioneers, but the SHARX is very slow. Other Blaupunkt models have faster-acting SHARX for selectivity, so maybe RDS is also faster. Anyone done a comparison between a "fast" Blaupunkt and a JVC or Pioneer.
I did a comparisons between The Blaupunkt Casablanca CD52 and the Pioneer DEH-4700MP (2007 model)
http://youtu.be/ytcsqkmORFg http://youtu.be/ytcsqkmORFg

& Blaupunkt CD52 and the Pioneer DEH-1200MP (2010 model)

I've worked in Algiers, and most of the summer time, the band is full of spanish stations, but they are official stations coming trough a common and very favorable propagation.
It is easy to see as in the algerian FM band, only few station are tranmsitting, so the band is really quiet even in algiers.
I used to do indoor DX, up to 600Km with the degen in my bed at the hotel. The signal was strong and stable during the days, and totally null in the morning.
Only few algerian complain, they use to listen to these station that, for most people have always been there...

Some spanish people could complain, the few algerian station that are on the air are very high power and often received by Tropo up to the mediteranean coast in the south of France.

Tropo is Tropo :)

Hello, I went to Algeria in 1970. At that time, there were no transmitters FM band and, on the coast, several Spanish stations were heard. I even could receive a small sporadic E propagation in the month of July: I heard french, Italian and spanish stations during 30 minutes.

Hmmm, I sent a message about this topic & it has gone up in smoke! Don't know what happened there, but I will type it again. Apologies if it re-appears later on.

I can only assume that if Spanish pirate stations are broadcasting from boats on international waters, then it is to escape the most likely severe punishment from their own government if caught on land. This is the first I have heard of this, as I have lived in Spain in the past.
The FM band in Spain had way too many stations, & is probably still the same. Not only national broadcasters like RNE, SER, COPE, etc... but also small local stations which were more than there should have been. It did not leave much room for DXing.

The K?rner 9.2 is on the roof of the bungalow at last! The permissions letter came through yesterday, but the aerial contractor who was coming today let me down. As luck wouldhave it, I found somebody else who was free this afternoon. The 9.2 is approximately two metres above the roof, perhaps slightly higher than at the last address.

The rotator is not connected at the moment due to problems drilling large enough holes through the brickwork to feed the control cables through. Even the aerial contractor did not succeed with his SDS drill, so I am forced to use a couple of external connection boxes and run the dreaded CAT5 cable into the room. This is just thin enough to squeeze through. The 9.2 is currently fixed east-south-east.

Reception of Hoher Mei?ner, Torfhaus and Brocken were almost noise free on scatter peaks during the late afternoon.early evening. Bielefeld on 103.0 has also been received as well as I have ever heard it, practically noise free when lifting up.

Providing I don't get any more internet disconnections tonight I will be monitoring 104.9 for meteor scatter.

Good DX!

** Personal Skegness 'First' by the respective mode

The 9.2 is really doing the business, but I really ought to lower it
slightly as it is swaying quite noticeably, even in the gentle breeze. I
won't lower it too much, but it looks quite imposing up there on the
roof at almost three metres above the rooftop. It is actually quite easy
to raise and lower it as necessary.

The two NRW firsts were a pleasant surprise, as was Pfaffenberg. I was
almost certain I could hear the latter on scatter when I had just moved
in to the last QTH, i.e. before all the noise started. I guess it must
have been Pfaffenberg all along. There are other bits and pieces across
the band too which I hope to identify here at the new QTH. It's a relief
to have the 9.2 installed before the Es season, but I still haven't had
time to install the rotator cables, so the antenna remains fixed to the
ESE for another day. This job is at the top of my To Do list for tomorrow.

Good DX!

** Personal Skegness 'First' by the respective mode

The G-5500 rotator is now connected and aligned. Still really pleased with reception here. As I had hoped, the noise I get to the south is greatly reduced now the 9.2 is on the roof. It appears to be something in a nearby property. the one nearest the 9.2. At the most I am receiving the noise at 9 or 10dBf (GTK scale - no boosts), which is negligible. Background noise in all other directions is at 4 or 5dBf so very quiet. Phew!

Good DX!

Sounds like Sud Tirol Eins in the advert.

The music which trails away after this is from RTL Sachsen, Chemnitz.

Thanks

John

No wonder I couldn't find this under Austria. It is an Italian station called Sudtirol Eins from Brenner in the Bolzano area. The power is just 1.5 kW.I have W4WDX to thank for this one again.

Good DX!

Last Friday I was walking the Northumberland coast path yet again but further North this time nearer the Scottish boarder, I climbed a sandjune and the two ensembles from Norway, 12D Norge Riks and 13F Ager Rogaland, popped up again on my Roberts Pocket DAB. I am still really surprised considering the 400mile distance across the North sea.

Also I got some Norway FM DX - 94.2 NRK P1 (Rogaland) Bjerkriem.
BBC Nationals, Meldrum, Sandale, Black hill and Bilsdale were audible.

I may have got more if I had access to FM List on my walk. I did not know what Norwegian targets to try for on FM.

Hi list,

I’m getting a slight enhancement to the North today in London. Amazingly, I’m getting Heart Bedford over the top of Capital Xtra on 96.9, despite Crystal Palace being in line of site! Actually, I can’t see Crystal Palace this morning due to the fog, but I usually have a clear view of the whole tower.

Holme Moss is up in strength too.

Regards,

Martin

** Personal Skegness 'First' via the respective mode

After several days of scatter from Brocken, Torfhaus and Inselberg, all reception has now gone after a front moved through this evening. Even Lille is not getting through. Sutton Coldfield has also disappeared and Belmont has dropped a few dB. This would normally make things good for meteor scatter, but even that seems to be down. So much for a possible peak. Perhaps things will recover over the next few hours.

Good DX!

Hello Ruud,

I can't find another SDR Android app with RDS apart from Wavesink.

The author of SDR Touch has RDS on his "Things to do" list

You might need to use a powered USB hub.
Most phones don't provide enough power for the RTL dongle.
(You might also need to root your HTC phone).

My small tablet has enough power when using Wavesink which just displays one frequency, but not SDR Touch which gives a wider view.

Peter

Now, that is a really good pull. Congratulations!

Vertical. Tx power seems not to be given, but I guess it must be 20
kW max. A lot less, possibly, or even likely.

Every now and then, there seems to be written somewhat foolish things
about MS reception to vertical antenna.

To my location, the Lyrids has been so far more or less painstaking.
During the weekend, aurora messed the whole band into a thick
porridge. On Monday and today, the Lyrids has given some good
concentration peaks, and occasional bursts up to 30...45 seconds in
duration. I even got a couple of tx's new to me, on MS.

Hi Ilkka,

Out of your last five or so messages, I did not understand four. Also when using google translate I have no clue what the below lines are about. Certainly not DX related. Please stay on topic. Soon the Es season will start and when it does, this reflector will be getting very busy. Lets stick to our main business please.

Thanks.

Janpeter van Dijk

Hello Ruud,

There is a non-sdr app that works on some mobiles, including HTC, which adds RDS with a PI code to the mobile's own radio. it was mentioned on this Group before, but I can't remember what it is called. I do remember the author is a YL.

31540. Good Meteor Scatter Now

Yahoo group: SkywavesDX (2014)
Date: 2014-04-23 08:59:37 UTC
From: John Faulkner, Skegness
Topic: 31540 Message: 31540

After a disappointing Lyrid shower, they have finally appeared out of the woodwork this morning. It's a pity I have to be out all day. :O(I recorded 97.7 overnight but will have to catch up with that later. I am not expecting much as it looks like Manningtree took over for a lot of the time, as did Nordhelle on 104.7 yesterday - catch up soon.

Good DX!

John

31541. UNID Radio Evropa Plus 87.5 via Meteor Scatter

Yahoo group: SkywavesDX (2014)
Date: 2014-04-23 09:03:28 UTC
From: John Faulkner, Skegness
Topic: 31541 Message: 31541

Briefly, while Andy Webster and Chris Thatcher were here yesterday morning, we caught a long meteor burst of up to a minute at the moment I switched the XDR on in the morning. I hadn't had chance to set up any recording, but we all heard what we thought was a Evropa Plus ID. The radio was on its default switch-on frequency of 87.5.

After checking FM List we saw that the closest Evropa Plus was in Liski, listed with 160 watts at 2657 km. This seems highly unlikely if not impossible.

The language sounded Russian.

Does anybody know if there is a closer transmitter on 87.5?

Thanks

John

Thank you Ilkka.

So is Euronet a programme on Polskie Radio 1? It could account for the
ID we heard - part of a promo maybe. It would make more sense being Poland.

I checked their top of the hour ID at 2300 but it didn't contain this
ID. I would have recognised the Jedynka ID, had I heard it yesterday,
but it could have been buried in the fluttery mess of that meteor burst.
Oh well. It's one that got away.

Thank you very much for this.

John

From: <pe1etr@...>
Topic: 31549 Message: 31549

HEALTH WARNING: Those of a nervous disposition should not watch this video. There is a danger of having your socks blown off!

I'm been meaning to try this for a while. Today I finally got around to it.
The Sony ICF-SW7600GR has a line out socket (fixed level). I fed the audio to my netbook's sound card which is capable of 192kHz sampling.
PI code only, but very fast. (Super PI was activated in RDS Spy). I need to reset most times when I tune to a new station.[I'll try and find the PS name next time].
All stations are locals received in George Town (Penang) Malaysia.
The Sony portable radio is seen lying on the table next to my MSI U270 netbook. I'm just using the Sony's telescopic whip.

** Personal Skegness 'First' via the respective mode

Catching up after a few busy days.

Meteor Scatter Notes:

23-04-14:
At 0211 on the 23rd I heard a meteor burst lasting two and a half minutes. It was a jumble of noise with DLF being the only recognisable station, lifting out of the mess for a couple of seconds.

25-04-14
A very repetitive night! Just three stations popped up, but repeatedly! Over and over again: CRo Vltava, ?st? nad Labem; Big FM (Rheinland-Pfalz), Ober-Olm; Frekvence 1, Brno. I did not hear any other station via meteor scatter until shortly after 0700 when Radio Ognjisce, Krvavec broke the monotony.

General scatter continues to bring new stations to my logbook and much of it is noise free.

Radio Kiepenkerl on 107.4 was a possibility earlier today (25th), though I couldn't rule out this being Radio Lippe as the programming on their web stream sounded similar to that of Radio Kiepenkerl's. It definitely wasn't Radio Wuppertal. It would be useful to know if and when these local NRW stations have their own programming, rather than just inserting local IDs and drop-ins.

Good DX!

Thanks for the alert Andy. Just starting here now with the usual suspects. i.e. 88.0 RNE5 and Radio Nervion.

Good DX!

Yahoo group: SkywavesDX (2014)
Date: 2014-04-26 16:33:33 UTC
From: Tim Bucknall
Topic: 31573 Message: 31573

despite the dire condx a trip to a local hilltop produced a loud
Chinese Trawler on 30.375 complete with engine noise in the background

weaker ones on 24.9625,29.700, 30.2625

I suspect they were off the Moroccan coast as that path was definitely open
the MRC wavebuoy on 29.45 was in along with the CNR rptr 29.610 which
is in a great spot and should be very useful for props experiments

Sorry for the delay Ruud. I select 50 MHz Es on the Android DX Robot app. I also select the auroral alerts too.

"G" is my main country and I chose "BEL" as my secondary country as a possible early warning for Es, though "HOL" or "F" are probably just as suitable.

I definitely recommend the app. but I am not sure how much bombardment of alerts there will be until we are well into the season. The app updates/re-checks the conditions every 15 minutes. Make sure you don't accidentally switch it off accidentally, like I keep doing.

Cheers

John

31579. Band 2 Es Alert

Yahoo group: SkywavesDX (2014)
Date: 2014-04-27 08:38:23 UTC
From: John Faulkner, Skegness
Topic: 4099 Message: 31579

Sorry this is a bit late due to a few computer issues.

There were some minor Balkan or Slavic Es around 0610. Only 87.9 was affected and it was too weak for RDS. Balkan/Slavic music was heard fro about a minute. Nothing was ID'd here.

6m is trying too.

Good DX!

John

Radio Krym went over to Radio Mayak a couple of weeks before the Russian annexation of Crimea. I posted on here when it happened.

I will have to check some streams in the Squeezebox later to see if anything else has been assimilated.

Good DX.

Nick, Whitchurch, Hampshire.

Update - I have just checked Radio Krym's web stream again, which is here:

http://mail.tv.crimea.ua:8000/stream.mp3

It appears that the web stream is now relaying Radio Krym programming as I have just heard an ID after a couple of pop songs. Whether this is online-only or on FM as well remains to be seen. I cannot remember whether Radio Krym is on OIRT as it doesn't seem to be in FMLIST. Their website does mention 100.6 but OIRT would be a much better band to monitor if they are on there to see if the stream is in parallel.

Good DX.

Nick, Whitchurch, Hampshire.

Yamaha T-2, Denon TU-800L, Kenwood KT-1100SD (modified), Yamaha T-85, Sony XDR-F1HD tuners, Triax FM5 horizontal beaming east.

Now it has joined Radio Mayak so perhaps it goes over to Mayak during the evening and overnights? I'm sure it used to be Radio Krym 24 hours a day before the Russian intervention.

Good DX.

web 593km

The first Es of the season and some aircraft scatter to northern France
at last.

Brocken and Torfhaus were quite stable late in the evening with slow and
steady fades. This was either tropo or troposcatter.

I decided to leave the meteor scatter DXing alone for a few days as I am
sure the amount of web stream recording I have done over the last few
weeks will have taken this month's bandwidth well over the 500GB mark!!

Good DX!

** Personal Skegness 'First'

Meteor Scatter Notes:
I almost nulled BBC Radio Lincolnshire on 94.9 this evening, reducing it to around 7dBf (GTK display). This allowed BBC Radio London to join in every now and again at equal levels. I then recorded a few web streams and was pleased to hear France inter, presumably from the Bourges transmitter, briefly dominate the very weak Bemont via meteor scatter.

Aircraft / General Scatter Notes:
Since I now appear to be able to receive transmitters like Heidelstein, Hoher Meissner, Torfhaus and Kreuzberg Rhon on a regular daily basis, often at noise free levels during scatter peaks, I wonder how useful such loggings are. I know some DXers like to see all loggings as a representation of the conditions, even if they are sometimes on the repetitive side, but I suspect that many DXers do not. In view of the Es season being upon us I will leave out most of these duplicate loggings in future and only post them here occasionaly.

For the last few days I have been able to listen to Brocken on 94.6 almost constantly, with regular fading of course. Even som the signal can last many minutes, never quite dropping out completely. This makes me wonder what summertime scatter conditions will bring. Maybe I will be able to increase on my current scatter distance record.

Thinking about scatter, Kenwick Top is spectacular for this with transmitters like Raichburg, Sonneburg and Remda coming in noise free whenever I have visited. I have never heard these via scatter from home and they will now become my 'target' transmitters at home. I may need a lot of luck here due to my location being low down, almost at sea level.

Good DX!

Back on the main computer for a while. The laptop insists on randomly moving the cursor anywhere it wishes while I am typing.

Tropo to Holland and Belgium still exists here. I presume it must be very localised. It is not showing up on any propagation map either.

Signal strengths are good and with instant RDS on several transmitters, but the tropo is only favouring the larger transmitters.

Good DX!

Down here on the North Kent coast - A reasonable 'lift' through the day - one or teo of my usual German stations were coming through reasonably well in the morning. Spent most of the day installing a TalkTalk YouView box and setting it all up and then watching it! Not bothered with the extra internet facilities - just wanted it for the HD recording. As it comes 'free' with the package I've already got AND knocks £5 off the bil for the next 6 months I finally succumbed. Mind you I've a feeling these could be the kiss of death for FM DX if anyone near here decided to link to their router using PowerLine Adapters!

Tropo conditions are good this evening at least for the nearer coastal stations - Egem transmitters are full RDS with 0% ber and Lille is full RDS. Some of the lower power stations are also present includin RDL Calais at 200watts. Goes (NED) is not very good however.

Still waiting for my first SpE of the season.

** Personal Skegness 'First'

I have no idea where this tropo came from. Nothing was forecast and nothing was showing up on the maps. It looks like it was just this particular area which enjoyed the conditions.

At the time of the opening, the weather was interesting to say the least. Humidity was high, up around 100%. While the sun was out here, the sea front was shrouded in sea mist which could be seen blowing in like smoke from the North Sea, which was invisible unless you were within a few yards of it. We had taken the dogs to the beach and I had my Degen DE1103 with me as I wondered if the mist would cause any enhancement. Belgium and Holland were slightly up but not by much. It wasn't until returning home that I put the 9.2 vertical and discovered lots of Dutch signals at good strengths up at around 39dB.

This opening persisted from mid-afternoon until late evening, when I noticed Antenne Niedersachsen, Steinkimmen on 105.7 - on the vertical 9.2! Returning to the horizontal position, there were some good signals from the Niedersachsen area of Germany.

Around 3am, we were woken by a thunder storm. Time to unplug the aerial! There were a few thunder storms trundling their way north-by-north-eastward and had been during the late evening.

I was not DXing alone though as I had been experimenting with some new software called TeamViewer www.teamviewer.com. This had been recommended to me by Cedric in France. Andy in Wigan and Dave in Brighton were both tuning along with me. Quite a weird experience to watch the radio apparently tuning itself! I will write about TeamViewer in a separate post as I also wanted to try Chrome Remote Desktop too, both for the computer and for the mobile. More about that soon.

Time to unplug the aerial again as I hear more thunder. :O{

Good DX!

Should I reverse the direction of the 9.2 for OIRT band reception? I may have asked this before but my memory never serves me well these days.

Does anybody still have the link to the website where 9.2s can be bought? A friend has been asking.

Thanks

John

Yes a very good experience tuning John's XDR from here very strong Dutch/German stations. John has a very good location for DX so much so I was at it this morning and it can get addictive as conditions were not as good as last night but still Dutch/Belguim/German stations coming in.

31616. XDR-GTK Oddity

Yahoo group: SkywavesDX (2014)
Date: 2014-05-02 10:27:35 UTC
From: John Faulkner, Skegness
Topic: 31616 Message: 31616

I thought I would have a play with my Fringe Electronics pre-amp this morning, but the XDR-GTK software seemed unable to run the XDR at first. After a while I discovered that I had to have the XDR switched on for around fifteen minutes before I could activaye the XDR-GTK software and control the XDR.

With the XDR connected to my main computer, the switch-on duration is about fifteen seconds before the XDR GTK software will run it. The laptop takes much longer for some reason - about three or four minutes. But with the pre-amp inline on the laptop this increases to a ridiculous 15+ minutes. So why is there a such a huge difference in these times? I don't understand why the pre-amp has this effect.

John

Hi John,

Something in the software can be edited to make the wait time automated. I don't know what though, but you could ask the guys that helped you with the software installation.

I have to have the XDR switched on for a minute or two. If you do the diode mod as well that overcomes the issue.

I don't fully understand the comment about the FE pre-amp. Surely that connects to the XDR's antenna input and the PC connects by USB through the SEED board to the XDR? The SEED board connects to the control circuitry - not the RF circuitry. Unless something weird is going on and the control circuitry checks the RF input for something (?) and the FE pre-amp is somehow blocking that? Is the pre-amp under power when you try to connect? If it isn't maybe that is the issue?

Cheers

Stuart

Thanks for info - I too had looked for this on-line but couldn't find it.Or 64.90 Euros for a kit.

I'm currently using a "K6STI" 5-ele small yagi on the rotator mounted on an 18.5ft high mast in the garden which is performing very well. Gain is less than the Korner and f/b not as good as the Korner - but it's a whole lot better than the FM3 I started off with. I got a great deal of pleasure out of biulding the thing from scratch. If I put up a Korner 9.2 on that mast it would probably fall over as soon as it got windy!

They also do what looks to be a nice 8 element (they call it 16 elements) DAB antenna at an attractive price. I'd just like to know what to use as a 'decent' DAB/DAB+ receiver.

That's right Stuart regarding the connections. The pre-amp is powered by a Fringe Electronics 'isolated' psu. I cannot imagine why this effect should occur as it has nothing to do with the Seeeduino board - at least, as far as I know.

I am known as be the one who has the most peculiar oddities with anything and everything relating to computers, but this one got me scratching my head and so I thought I would mention it here. I am just curious, that's all. But maybe there is a valid reason for this extended 'warm up' time and there could just be something I am doing wrong here which I need to know about. i.e. for the continued safety of the equipment. 15 minutes tells me there is something the Seeeduino controller or software doesn't like.

I think you are also right about me looking into getting the diode modification done.

Cheers

John

Hi Janpeter.

I will contact Konrad about this and report back.

Nice to use the pre-amp again though, just as an experiment. I don't think I will be using it again in a hurry as the noise level lifts up too high for my liking. It's not 'easy' on the ears at all. The pre-amp was by the receiver and not on the antenna where it ought to be. Interesting results though - it does seem to drag in a bit more DX though as my log will testify.

Hi Dave,

I own and can recommend the Roberts Stream 83i. This radio works on DAB/DAB+, FM (with Radio Text) & Internet Radio.
http://www.amazon.co.uk/Roberts-Stream-Stereo-Internet-Speaker/dp/B002VEN10O
It can also be connected to an external antenna (for DAB/DAB+ & FM). By removing its telescopic antenna, an "F" type connector (as found in satellite receivers) is revealed.
From here in Lincoln, using this radio, I can receive the HBB&Northants MUX (from Sandy Heath), using my 5 element Band III antenna (at 15 feet AGL). Even in "flat" conditions, the signal drifts in and out (from "boiling mud" to perfect audio).

Ditto what Chris said. :O) I also have the 83i. It is an excellent
little radio.

The FM section is as 'wide' as a very wide thing, as you might expect,
but it is sensitive and actually receives very well when an external FM
antenna is connected.

Hello all and good vibes for the May;) Has anyone ordered Kö 9.2 from Antenneland (were they from Austria, or Germany..don't remember that now) ? How were the components marked and all ok ? Just curious, credit card accepted ? Thinking of replacing my V pol 8 el.Triax with Kö 9.2 (I have also Kö 15 element horizontal for some three years or so (time flies..). Or should I finally also try my 10 el log.per by Italian RKB (lazy me, been in the box for six years at least). Never tried log.periodics on V pol. but I think they would do the business as well. Tomorrow will install my 5el. RKB log.per back throug the balcony glasses (top floor here), pointing south. 9km's towards south west 60kW Digita / Yle mast which is a painf of *ss.

dx73s Hannu / "Watcher of the skies" saw Steve Hackett's Genesis Revisited 2 last sunday. Magnificent gig.
Suomi (+ 3 C finally rained), snow seen today in parts of Finland. Next week more chilliness from North-east..

31625. Re: [SkywavesDX] XDR-GTK Oddity

Yahoo group: SkywavesDX (2014)
Date: 2014-05-03 08:56:03 UTC
From: <davebunyan@...>
Topic: 31616 Message: 31625

Hi John,

With regard to the Fringe pre-amp - gain is way too high - seems to be 25dB mid-band. I stick a variable pre-amp in line and adjust it on a weak noisy signal by turning the gain down until the signal becomes slightly noisier and then turning it back up slightly. That way I don't risk overloading the tuner(s) but gain any benefit from an improved signal/noise ratio.

I prefer my home-built mosfet preamp with about 12-15dB gain at the aerial end, which, by the time the signal has gone over 30m of coax and through a couple of two way splitters gives an overall gain of about 3dB.

I'm impressed by your 700km+ tropo results under the current conditions - a long sea path really helps I reckon. I've not been impressed by lack of spring time tropo lifts this year although weak tropo-scatter has been surprisingly good.

Rgds

Topic: 31616 Message: 31627

I have lots of those moments lately. Usually it's because I am doing too many things at once, rushing everything.

I probably won't use the pre-amp again in a hurry. It was an interesting experiment. If I located the pre-amp right at the aerial then things would be much better. The pre-amps was in use this way at the previous address, pre-noise era, and brought in some good scatter from Brocken up to 2011/12.

I am not hopeful of increasing my scatter distances due to being right down close to sea level.

So why is scatter so much better at the moment? Traditionally, this is the least productive time of the year for tropo and general scatter, but I have been surprised at what has been coming through. This brings me to something I meant to include in my notes a few days ago - the fact that the sea temperatures here are really WARM at the moment. These would be considered warm for late summer! The North Sea is shallow here, not getting any deeper than 50 metres, so it heats up much more quickly close to the coastline, but can also cool down quickly. The waters in The Wash are even more notorious for this effect too, often freezing over in parts during the winter. I doubt there would have been any freezing over this winter though. When I dipped my fingers (yes, fingers, not toes) into the water the other day, I was taken aback by how warm the water was. It was Jane who first noticed this. I guess this is what is producing the results on band 2 at the moment.

Yesterday was supposed to be cold here, 11 degrees C and with a bitter north-easterly breeze. It was actually very warm in the sun with a gentle breeze. It's definitely tanning weather at the moment, especially with the temperatures predicted to 'soar' into the low 20s over the bank holiday period.

All this lack of winter and the recent warmer temperatures should surely reap big rewards for us come the autumn, providing it stays warm. The current results are already unusually good for this time of year.

Good DX!

above Tournai. Testing pre-amp 606km

** Personal Skegness 'First'

I plumbed in my Fringe Electronics 22dB pre-amp today, remembering how
good this used to be at the old QTH. Back then, it was installed at the
mast head, but today I only connected it by the receiver, just to see if
it made any difference. The Fringe Electronics pre-amps are known for
their good signal-to-noise figures.

I suspect it DID make a difference as I heard more continental DX than I
have heard here to date. It enabled me to hear NDR Info from Schwerin on
105.3 for the first time on scatter anyway, so that seemed very promising.

The one thing I didn't like with the pre-amp inline was the increase in
general FM mush, which you are bound to get, but when signals peaked
they really did seem to be relatively noise free compared with the
reception I am used to. I just prefer to listen to an FM band without
any horrible mush. I will have a play with this again at some point, but
probably not in a hurry, and connect it in such a way that I can make
quicker 'before and after' comparisons. Instant comparisons are
necessary with constantly fading scatter.

Good DX!

31635. Tropo to Spain possible

Yahoo group: SkywavesDX (2014)
Date: 2014-05-03 20:09:17 UTC
From: Jim Smith G0OFE
Topic: 31635 Message: 31635

No sign of anything on Band 2, but I am hearing Spanish stations from the north coast here on 144Mhz.

Jim.

Bournemouth, Dorset IO90BR.

8 element OP-DES yagi at 22-32ft, wideband vertical, Perseus SDR receiver with FM+, Funcube Dongle Pro+.

Bournemouth Weather online: http://www.g0ofe.com/weather

31636. SR P3 at tropo

Yahoo group: SkywavesDX (2014)
Date: 2014-05-03 20:09:38 UTC
From: Christian Stödberg
Topic: 31636 Message: 31636

Hi! I’m speaking to a good friend in Salzgitter, Lower Saxony in Germany and he can hear SR P3 on 97,2MHz sometimes at troop if he stands on higher spots.

Now I’m considering which TX it may be. Uddevalla/Herrestad or Visby/Follingbo? 696km to Uddevalla and 792km to Visby. Both are standing almost at the sea.

He has no PI information etc.

Which one do you think is most possible?

73’s de Chris

31637. Re: [SkywavesDX] Tropo to Spain possible

Keep an eye on that Jim. DX Maps has been showing a persistant Es MUF of > 180 MHz off the coast of Spanish Sahara/Mauritania with reports from marine stations on 161 MHz. However, I suspect it is a tropo duct due to the stability and duration of the opening. If it links up with the duct over Biscay....

Good DX.

Nick, Whitchurch, Hampshire.

Yamaha T-2, Denon TU-800L, Kenwood KT-1100SD (modified), Yamaha T-85, Sony XDR-F1HD tuners, Triax FM5 horizontal beaming east.

Hi Tim yes I have just noticed that Real is playing the same as Heart just how many does one need.

Just shows how our Radio is going down the pan so why don't they have one high powered Heart/Real and shut the others down and give me some gaps for DXing.

Dear Colleagues, information about what radio stations and TV channels broadcast from transmitting the centers in Donetsk and Lugansk regions of Ukraine most rapidly updated in the next Ukrainian site:
http://ukrtvr.org/efir-po-naselenikh-punktakh.html
http://ukrtvr.org/efir-po-naselenikh-punktakh.html
http://ukrtvr.org/efir-po-naselenikh-punktakh/27-donetska-oblast.html
http://ukrtvr.org/efir-po-naselenikh-punktakh/27-donetska-oblast.html
http://ukrtvr.org/efir-po-naselenikh-punktakh/27-donetska-oblast/370-kramatorsk-misto.html
http://ukrtvr.org/efir-po-naselenikh-punktakh/27-donetska-oblast/370-kramatorsk-misto.html

Information and news about events in Ukraine due to the Russian aggression (including information captures separatists transmitting centers), the most reliable operational at the following site (in English language):

http://inforesist.org/?lang=en http://inforesist.org/?lang=en

Also helpful have a website, the creation of the students, who accuses the wrong or inaccurate information in the news about Ukraine. In the version in Russian are more publications:
http://www.stopfake.org/ http://www.stopfake.org/

I certify that me these sites - most of those are true, I know. Recognize that actual events - very important in the information war waged by Russia against Ukraine.

Aleksandr,
Poltava, Ukraine

Thank you for your attention to the events in Ukraine!

Armed saboteurs (actions which coordinate of the Russian Federation) captured radio transmission center near Kramators'k. Within them were people who had skills like radio equipment. Specialists saboteurs completely disable broadcasting all Ukrainian TV channels in digital format, and almost all TV channels in analog format. Also they turned Ukrainian radio channels broadcasting.

Instead Ukrainian channels saboteurs began broadcasting the Russian TV channels : "Россия 24", LifeNews, "НТВ" and similar channels, which broadcast propaganda against Ukraine oversaturated.
These Russian channels covering the events in Ukraine mirror about reality. And then it's not that they serve their opinion about the events, they deliberately manipulated facts.

The traitors, criminals terrorists who are operating in the Donetsk and Luhansk regions of Ukraine, the Russian media show as heroes and defenders of the interests of the people. And people who are defending their homeland Ukraine Russian TV channels called fascists and offend all sorts of ways.

Today thanks to the success of the anti-terrorist operation in Kramatorsk transmitting center back under the control of the Ukrainian State Concern "KPPT". Russian TV channels switched off and almost completely resumed broadcasting Ukrainian TV channels. Ukrainian radio channels broadcasting resumed until partially.

One of the reasons this has happened was the failure of the Radio Authority and then Ofcom to licence a national pop network on FM in this country. The BBC has a monopoly with Radio 1 and Radio 2 and naturally the local stations have evolved and morphed to fill the gap between those two stations.
The other problem is that there is not much money to be made from radio in this country. Many of the smaller stations are being taken over by The Breeze, but I think it's better that these stations stay on air to provide local news and information even if it is networked from 100s of miles away rather than close down. But from a DXers point of view it would be nice to have the frequencies cleared ;)

Just my cents in - everyone seems to propagate his own 'pravda' ('truth') nowadays. One-sided views on both sides. IMHO. Thats why it sounds a bit, well, exagerrated (to say the least), when someone claims to know the absolute truth for others to take for granted...
As for rather scary terms used by Alexander (criminals, saboteurs, separatists, terrorists), i heard them all before, some 20 years ago in Moldova with respect to those in Pridnestrovye. What it all ended up with - we know much too well now.

Re: video - those two guys interviewed were the guard working in shifts. They couldnt tell much as they reportedly spent most of the time in a watchbox. They confirmed the arrival of some armed people who seized the transmitting centre.

Dear, Leo bartolomeo, I apologize for the harsh words.
But believe me, they are worth...
Defend your homeland or fictional truth - are two big differences.
If the problem was propaganda - how many people have been killed or injured protecting Ukraine from these bandits.

Didnt really want to say that but - were those people (including pregnant woman crying out for help on some recordings available online) shot and/or burnt alive in Odessa, all bandits or criminals? Or maybe they were killed by those mysterious 'bandits'? Or those girls preparing the notoriious Molotov coctails, are russian intelligence agents? :-0

Try to face the truth as is and dont get mislead by ANY propaganda, whether coming from Kiev, Moscow or any other part of the world...

As for the video regarding the Kramatorsk txing stations, there are quite a few funny moments in those interviews with the two soldiers... Now thats a fiction...

Not sure if its been posted here or not, but in Donetsk there is a 30W relay of Vesti FM along with some local programming on 90,5 (active since mid-April).

I have been recording some DX over the last few days.

http://skegnessdx.blogspot.co.uk/2014/05/recent-dx-videos.html

YouTube video page: https://www.youtube.com/channel/UCOrAbHyPpIflDXo62HWyOiA

Sorry about the lack of audio on some of the videos. YouTube have been at it again, censoring content unnecessarily. I don't understand how so many full length pop videos are allowed to exist on YouTube while some, like DXer's video clips, get blocked when they only contain a few seconds of scratchy audio.

John

Dear Leo Bartolomeo! Yes, in Donetsk has broadcast on 90.5 MHz. The following page contains the information about this transmitter: http://ukrtvr.org/efir-po-naselenikh-punktakh/373 http://ukrtvr.org/efir-po-naselenikh-punktakh/373 .
I agree that there are some of the people in Ukraine who support the actions of the separatists, but they are definitely the minority. On any product there is always howling buyer.
A relatively weeping girls separatists, then I'll give you an example of how the same girl, "Cry" and Kharkov and Odessa in the Crimea. Does not impose on any thoughts?
http://www.stopfake.org/en/ardent-participant-of-pro-russian-protests-from-a-soldier-s-mother-turned-into-a-refuge-from-donetsk/ http://www.stopfake.org/en/ardent-participant-of-pro-russian-protests-from-a-soldier-s-mother-turned-into-a-refuge-from-donetsk/
http://www.stopfake.org/en/donetsk-refugee-turned-into-a-crimean-activist/
http://www.stopfake.org/en/donetsk-refugee-turned-into-a-crimean-activist/
And these "weeping mothers" Russia has thrown a lot of Ukraine in order to mislead people. Through such actors Russia Todai and similar TV channels make their "beautiful" pictures for stories news.
Believe me, I live in Ukraine perfectly see what happens next to me. If I had not seen, it is not written or argued here. I have always supported Russia and now think nothing bad about adequate Russian people. But I am against the aggressive policy of the Russian president and his aides in relation to my country - Ukraine.

Alexander, I'm ashamed of what you turn DX-newsletter into a platform
for political campaigning. I live in Eastern Ukraine, a lot of talk
with a population of Donetsk, Kharkov, Lugansk and other areas, and I
want to say that people in these regions against the current Ukrainian
authorities. I note that in these areas the Ukrainian language quite
unpopular - less than 10% speak Ukrainian. In this case impose
alien language to us, which, incidentally, is the only official
language in the country! Why in Belarus has two official languages -
Russian and Belorussian? Why Switzerland has four official languages?

Now about the radio. Several interesting AS and MS on Band I during
last days:

The 90.5 transmitter reportedly is (was?) 30W, not 70W.
http://tubes.radiostation.ru/forum/?fm=4&act=msg&topic=10616

Its been discussed many times before - dont extrapolate your own opinion or (rather limited - geographically) experience onto other people, speak for yourself, not on people's behalf. Let EACH region decide their fate on their own, by means of regional referendums, thats it. Scotland is going to have one this year, if im not mistaken. This is a civilized way of solving such issues...

You nicely evaded my questions regarding recent massacre in Odessa, showing some pictures instead. Ive seen many, e.g. the ones of a right wing maidan activist also filmed years ago while being 'trained' in an Estonian military camp.

There are more countries participating in this confilict (not just Russia), each playing its game and ruthlessly pursuing its own goals or interests. As usual, Russia's guilty of all deadly sins, regardless...

All this has nothing to do with this mailing list. Especially given our broken English beyond native speakers' comprehension. Period.

I am not accusing Russia of all mortal sins, I am sure that in this country the vast population - good people. But I am very against the aggressive policy of Russia in relation to Ukraine.
I have not seen the ones of a right wing maidan activist also filmed years ago while being 'trained' in an Estonian military camp.
I saw a story on Russian TV (Первый канал) that they were prepared in Lithuania. But the Lithuanians are very friendly Ukraine, so this helped to expose this fake:
http://www.stopfake.org/en/how-the-stories-on-russian-first-channel-are-created/
http://www.stopfake.org/en/how-the-stories-on-russian-first-channel-are-created/

Regarding events in Odessa very detailed in this page:
http://inforesist.org/photo-fact-what-has-really-happened-in-odessa/?lang=en
http://inforesist.org/photo-fact-what-has-really-happened-in-odessa/?lang=en

Look at how it all began, is to this day one touch tent camp separatists, very long time for them to base "Kulikovo Field" in Odessa was intact.

31671. 90.2 DFM, Tallinn via MS ???

Yahoo group: SkywavesDX (2014)
Date: 2014-05-06 20:51:48 UTC
From: John Faulkner, Skegness
Topic: 31671 Message: 31671

I just received a comment on one of my YouTube videos from January 30th. When I checked the page I noticed another comment I had missed - both of which claim to hear a "BFM" ID at 38 seconds into the recording. Thank you's go to Artur and Gianni for spotting this.

Here is the video: https://www.youtube.com/watch?v=aVDuY0MAlfM Check 38 seconds in.

I hear the "BFM" reasonably clearly and took a look on FM List. Nothing! Nor was there a VFM. I couldn't help but notice the unusual accent of the YL presenter, which sounded almost oriental to me. Then I realised it might be Finnish or Estonian. Checking FM List again I see there is a DFM in Tallinn. It's listed with just 1kW. Could it really be this station?

Please can somebody confirm this.

Thank you.

John

John, hello, for my ears this sounded (99-100%) like DFM 1kW from Estonia, Tallinn tv mast tx. Mixed like an ad or
slogan sounding estonian (bit of finnish sounding too..but I'd say estonian language). This station
should be russian speaking (D(ance) FM), so don't know if they have any estonian language ID's or whatsover.
On 0:07 there's strange language which couldn't catch, maybe the same station as on 0:38..

so my vote goes to DFM Estonia (with a just a little bit suspicious thoughts>but nigttime they can broadcast whatsoever, just listened a bit they were running some EDM mix..with UK some dj)

also ITA, HOL 100% NL at least..
Hannu (without headphones, just listened through laptop external speaker monitors)

Thank you Hannu.

I think it probably is DFM in Tallinn. Like you, "it throws a spanner in the works", as we say, with the main station language being Russian and carrying dance music. This is not what is on the recording. I need to record DFM overnight to check on what happens with their programming.

I listened to the web stream and I can tell you that the UK DJ doing the mix is John Digweed. I have just been reading up on John Digweed and discovered that he used to perform at "Renaissance", a famous nightclub in Mansfield, the town where I used to live, many, many years ago. Small world!

It's a pity that the DFM website doesn't give us any more clues about programming. http://www.dfm.ee I must say, the web audio, despite some compression, is very good.

Thanks again Hannu.

Hi John, Hannu,

“DFM” she seems to say, yes. But sorry to spoil the party as..

-the language is not Estonian
-DFM is a pure EDM station playing hard dance versions of today’s hits. News on the hour are also highly energized, if you know what I mean (this lady was not).
-DFM is in Russian only with the rare exception of mentioning Estonian addresses and places in ads

So, like Vicky Pollard used to say, yeabutnobut ;-)

Best,

Jukka

Juha Hi ! Yesterday I was looking for those PI:s John saw on fq, and while looking our Online log database from the past 14 years on 90.2 I had a slight clue about romanian (corrupted PIs said that and searching with those numbers romania PIs came "visible") but did not say it out loud ;)..so mixed words sounding like estonian / finnish mixed but now and as John antennae is pointed towards east/south so why EST could be booming on the fq at the "same time", so I'd say Juha's suggestion is the closest so far.

John: Diggers was one of my "heroes" when I followed progressive house movement in the 90's..

Hannu

don't have ROU station list at work pc so could there be any good ideas from ROU (or HNG) on 90.2 ?

ps. pity that we don't hear signals from outer space ;) echoes from history or something more interesting..

31679. Re: [SkywavesDX] 90.2 DFM, Tallinn via MS ???

Yahoo group: SkywavesDX (2014)
Date: 2014-05-07 15:01:11 UTC
From: John Faulkner, Skegness
Topic: 31671 Message: 31679

Hello Jukka and Hannu.

Thank you for listening and for your help. I had already posted on the YouTube page earlier but ran out of time to post here as I had to go out.

My findings will only confirm what you have said Jukka, and also what Hannu suspected. I recorded DFM's web stream overnight and heard nothing but dance music and high-energy Russian ads and news. Nothing I heard sounded like that snippet of meteor scatter, though to be fair, it was all too brief. Nothing is conclusive on this. If anything, listening to DFM conclusively says that my MS recording must have been of something else.

I won't persue this any further, unless somebody knows exactly who this station is. I wondered about Hungarian as I believe that is part of the "Finno-Ugric" language group.

Hannu - your post just came though while I was typing.

Don't worry. I was convinced it was DFM for a time.

As for the PI codes n the video, they are the random ones which sometimes appear. Don't worry about those. I doubt there are any correct ones in there, unless you've seen a particular one.

Thanks

John

From: Andrew Webster
Topic: 31682 Message: 31682

Today I noticed changes to the stations in the title so decided to draw up a list of the changes.

88.0 Real Radio Wales PI:C6A3 PS:REAL now Heart Wales PI:C6A3 PS:HEART.

97.1 Heart Wirral PI:C36F PS:HEART now Capital PI:C373 PS:CAPITAL.

100.7 Heart West MidlandS PI:C467 PS:HEART no changes.

103.4 Heart North West and Wales PI:C36F PS:HEART now Capital PI:C373 PS:CAPITAL.

105.4 Real Radio PI:C3AE PS:REAL now Heart PI:C3AE PS:HEART.

105.7 Real Radio Wales PI:C6A3 PS:REAL now Heart PI:C6A3 PS:HEART.

As a joke I referred to Real Radio Wales as Heart Wales and blow me down today that is exactly what happened no doubt the PI's will change in due course.

Andy

Hi All,
Sorry if this is old news but I just noticed reports of a new meteor shower that could be a possible meteor storm.

Debris from comet 209p/linear is due to pass by Earth 0700-0800 utc on 24th May.

Rates of 200-300 per hour or greater are being forecast so could be well worth getting up early and having the radio on.

It has been mentioned before, and the Daily Mail has actually got an article about it on it's on-line edition today (8th May. A look at G0ISW's web-site http://www.qsl.net/g0isw/g0iswms.htm http://www.qsl.net/g0isw/g0iswms.htm has an interesting table of the various meteor showers and the peak hourly radio rate - going back a number of years - which shows it's not completely new. The table is about two-thirds of the way down the web page. There is an "Uknown??" entry for May 24/31 with data for 2006-2008 and 2010 and the numbers are quite impressive for a couple of the years.

** Personal Skegness 'First'

A night of mostly very short pings, but with some longer burst around dawn which lasted around half a minute.

104.1 around sunrise became a mixture of Joe FM from Egem and the new outlet of Radio 10 from Arnhem. Radio 10 seems to be dominating most of the time when scatter is present, but WDR4 from Olsberg also shows itself from time to time.

Good DX!

https://app.box.com/s/sf98fvmycuu78uor2lp4

This nostalgic French language station popped up at 0310 this morning and lasted for 35 seconds. I have a feeling that the distinctive programming style may give this one away ... hopefully. There is a phone number. Nostalgie perhaps? Or another Nostalgic station.

Thanks again for listening.

Good DX!

John

I agree :-)

The French telephone numbers are given out in a different way to English -
zero huit cent diz zero cinquante cinq zero cinquante six.

We would probably say - oh eight ten zero five five zero five six.

Google search on the number then gives you France Bleu - no clue to which
one though.

Cheers

Stuart

Merci C?dric et Stuart.

So 08..... is a national number, so no clues which province. I see
there are several FBs on 102.6. Mulhouse would be the logical tx, but
Caen also at a push. The rest are much lower power, but equally possible.

I never know what the MS activity will bring. Last night on 104.1 I got
several unexpected transmitters, including some lower powered ones.
These were heard several times too. None of the 'expected' German
transmitters appeared at all! I love the unpredictability of MS.

Thanks and good DX!

The phone number 0810 055 056 and the frequency 102.6 indicate that the
station is France Bleu Basse Normandie, located in Caen, Normandy.

The french phone numbers starting with 0800 are over taxed phone lines .
Companies using such phone numbers make plenty money when you call them ::)

Thank you Jean-Louis.

Sorry to ask another question - does the phone number in my recording definitely relate to France Bleu Basse-Normandie? I thought this was a national number. We have those extortionate-rate phone number here too.

France Bleu Alsace, Mulhouse, would be more likely - I have received the Mulhouse transmitter elsewhere via meteor scatter. If 0810055056 is specific to Caen/Basse-Normandie then that makes it 100%.

Thanks

John

Well John, you're right.

I just checked:

0810 055 056 is not specific to the Caen repeater but is a generic phone number used for any of the France Bleu network...

And 102,6 MHz is used by several France Bleu transmitters located in Caen, but also Oyonnax, Mulhouse, L'Alpe d'Huez, etc.

Look at the frequency plan on
http://www.frequence-radio.com/frequence-FRANCE%20BLEU.html

So it will be difficult to determine which transmitter(s) of the network you were listening to.

Jean-Louis

From: John Faulkner, Skegness
Topic: 31689 Message: 31696

That's OK Jean-Louis. Thank you for your looking into this.

Our telephone numbering system can be confusing too. I don't think I have ever seen a 'national' number that gives away subtle clues as to its locality or is region-specific. That would defeat the purpose of the numbers being 'national' anyway. I used to work for British Telecom (now BT) so I know a good deal about our system, but not those of other countries.

My initial thoughts were that the station was something quite 'local' and definitely not France Bleu.

Whenever possible, I record the streams of the relevant France Bleu stations, but they did not record over the last two nights for some reason. I think this is due to the software I am using though. I am sure I will hear this station again sometime and hopefully catch local programming. It's probably Mulhouse anyway, but there's no way of being 100% certain this time.

Thank you again and best wishes.

John

Band 2 Meteor Scatter:
102.6 0017 EST Raadio 2, Koeru (Jae) Lively pop track, as web. Two second burst 1708km **
102.6 0023 SVK SRo 3 R?dio Dev?n, Bansk? Stiavnica/Sitno (BB) Piano music, as web. Two second burst 1402km **
102.6 0045 D Radio TON Heilbronn, Schw?bisch Hall (bw?) Belinda Carlisle, as web 795km **
102.6 0310 F France Bleu, Multiple sites. Likely Mulhouse. This tx has been heard frequently via MS on 88.6 (France Culture).
OM with phone number. Tnx C?dric, Stuart and Jean-Louis for help with this **
102.6 0559 D RBB Fritz, Berlin/Alexanderplatz (brb) Pops, as web 880km **
102.6 0602 D Radio ffn, Cuxhaven Otterndorf (nds) FFN own news with OM over music, as web. Four second burst 571km **
102.6 0602 D NDR 2, Stadthagen/B?ckeberge (nds) Pops, as web. Three second burst 606km **
102.6 0649 D MDR Info, Weimar-Ehringsdorf (th?) YL talking to OM, as web 791km **
102.6 0659 EST Raadio 2, Koeru (Jae) In again with distinctive guitar playing, as web. Two second burst 1708km
87.6 1000 E RNE Radio Nacional, Multi-tx Top of the hour jingle. Live listening **
88.6 1125 CZE CRo Vltava, Klatovy/Doubrava (PL) 232D R-______. Live listening 984km

** Personal Skegness 'First'

A good night for MS. I chose 102.6, a frequency usually dominated by Tournai, but putting the aerial at 70-80 degrees meant that it was much less of a problem. This bearing also probably helped bring in Raadio 2 from Koeru. Radio TON and RBB Fritz were regularly heard on pings.

Estonia is one of three new countries I have received this week via MS. Latvia and Lithuania are the other two, but then my antenna has been pointing slightly further north than usual at 70 or 80 degrees. Even so, the Spanish reception on 87.6 just shows that anything is possible.

People are asking where the Es have gone. 1. We were spoilt by last year's phenomenal Es season in England. 2. We were sent an early teaser on the 26th with a brief band 2 opening. This was unusually early. Don't write off this year's season yet! We don't usually expect band 2 Es until the end of May, so anything before then is a bonus.

Good DX!

Hungary made it in here on 87.6 at around 1545 UTC for maybe 3 or 4 minutes: MR 1 Kossuth Rádió from Győr/Szabadhegy peaking at 2 bars with RDS. One or two very vague signals on other channels around the same time. That's it so far.

Good DX.

Nick, Whitchurch, Hampshire.

** Personal Skegness 'First' via the mode

Sporadic E Notes:
More teasing Es today! I first noticed some wonderful Gypsy music on 88.7. I thought it was France Musique at first until I checked their stream. Then I realised that the bottom of the band had opened. It seems the Es had reached up to 102.3 at one point, sadly while I was in town. I had left the XDR recording meteor scatter there.

The OIRT band had a few signals too. I heard several stations I could not trace to begin with. I first wondered if double hop was involved as I could not find any web parallels to the DX, but I quickly realised that the stations were probably old familiar Ukraine transmitters which are now carrying Russian services.
*
**Meteor Scatter Notes:*
I tried to null all my Belmont frequencies this afternoon, in the hope that I might reduce their signals enough to allow meteor scatter to override them. I heard several meteor bursts over 88.8. It is my

ambition to identify meteor scatter on every frequency across band 2. So far I am up around 110 frequencies so there is still a long way to go. This may be a little too ambitious, but I managed to get all Belmont frequencies down below 20dB this afternoon, with the exception of Lincs FM on 102.2 which I could only reduce to 30dB. Belmonts on 90.9 and 93.1 were relatively easy to reduce. I didn't try 98.3, which was almost 100% nullable at the last QTH, or 100.5. 94.9 has already produced Bourges on meteor scatter.

Good DX!

Hi Gunter,

I can confirm that in Simferopol on 68.24 MHz Vesti FM - received them yesterday via Aircraft Scatter // web.
May be local inserts - the situation in Crimea is not very clear now.

I propose to transfer the Crimea in country Russia in FMList - now in Crimea mainly Russian stations on air.

Is it possible to add Aircraft Scatter as propagation mode in FMList?

Hi Vladimir, thanks for the info re. 68.24. It was only a short opening, and I was not yet technically prepared for registering my reception.

Regarding the transfer of Crimea from UKR to RUS in FMLIST - I am totally unsure. From a DXers point of view, I think there is no need to change, we have the region identified by "KR" so we will always be able to distinguish.
The rest is a controversal political matter which I want to keep out. There are no comparable situations (to my knowledge, please correct me if I miss something), the next coming into my mind is Kosovo. which in FMLIST is listed under Serbia, because it is not listed by the ITU as a separate country.

Your suggestion re. "Aircraft scatter" sounds interesting. I wonder what others think about it. Actually it should be called "Aircraft reflection", this best describes the physical phenomen.

73,
Günter

Thank you Janpeter and Vladimir.

That is most helpful. I have bookmarked the page Vladimir. I also use this site for national network streams: http://www.nrcu.gov.ua/ua

I heard two or three other unids, the only one I can remember was on 67.19. This was not in // with the UR Promin' web stream. I could only remember this one thanks to typing it in the Skywaves chat. I must do that more often as it makes a useful reference.

Best wishes!

John

Günter,

Would agree with this.

Sticking to the ITU parameters will help keep any politics or controversy out of things and off this group, which is for the best.

Jim.

Subject: AW: [SkywavesDX] Sporadic E 2014-05-10

Regarding the transfer of Crimea from UKR to RUS in FMLIST - I am totally unsure. From a DXers point of view, I think there is no need to change, we have the region identified by "KR" so we will always be able to distinguish.

The rest is a controversal political matter which I want to keep out. There are no comparable situations (to my knowledge, please correct me if I miss something), the next coming into my mind is Kosovo. which in FMLIST is listed under Serbia, because it is not listed by the ITU as a separate country.

Thanks Vladimir - I cannot then identify whether it was this 17kw transmitter I received or the 200 watt transmitter from Shepetivka.

I cannot assume it is the stronger more distant transmitter as in 2013 I received UR1 on 65.96 from Iskrovka/PFKRRT which is 150 watts and an incredible 2412km from me (and id from the web stream).I use a cheap RTL/SDR stick with SDR# which allows the centre frequency to be easily identified and easily shows two stations 30kHz apart.

31734. 5 ele Yagi for OIRT Band

Yahoo group: SkywavesDX (2014)
Date: 2014-05-12 22:06:40 UTC
From: davebunyan@...
Topic: 31734 Message: 31734

I recently built the Small 5 ele yagi from Brian Beezley's web-site for 88-108MHz which is performing quite nicely and gives a lot better f/b ratio than the FM5. I've learned how to use the basics in the 4nec2 antenna modelling software - so wondered if the antenna could be scaled up for the OIRT band.

If you multiply all the dimensions by 1.419 the figures returned show a f/b ratio >20dB across the band 64-74 MHz with a f/b ratio of around 20dB and an SWR well below 2.0. I used 0.5 inch elements throughout. Boom length is about 78 inches / 2.35 m. Maybe someone with more expertise at antenna modelling software could check this out in case anyone is interested.

I don't have anywhere to add this sort of aerial and have to be content with a half-wave dipole. Now if only I could find a proven design for a 64-108MHz log periodic which would fit on a 78 inch boom and give decent f/b ratio I might have a go at that one day.

Band 2 Meteor Scatter:
87.6 1141 CZE Radio Impuls, Brno/Koj?l (JM) 2203 1219km

Band 2 Tropospheric/Scatter:
89.7 2001 D WDR 3, M?nster/Baumberg (nrw) Screechy classical, as
web, over a nulled Tacolneston 493km

Continuing with my mission to reduce all Belmont outlets to nothing, I removed Lincs FM almost completely today. This was the most difficult one to remove. A bit of playing around with the direction and polarisation of the 9.2 did the trick, but the beamwidth of the null was extremely tight. It was interesting to hear the signal from Lincs FM fading in and out on aircraft scatter. We live only a couple of miles from a local airfield and I suspect it's the local planes which are causing this effect as much as the high altitude passenger planes. I even observed the signal flutter in and out rather abruptly as a pigeon (or duck?) flew past the antenna!

I recorded meteor scatter on 102.2 but none of it was in parallel with any of the web streams I recorded. It was the same with the meteor scatter I recorded on 88.8 yesterday.

> so wondered if the antenna could be scaled up for the OIRT band

You could just scale the design, but since the OIRT band has a smaller relative bandwidth than the FM band, some benefits should be possible by reducing the antenna bandwidth. Typically, put the new desired bandwidth around the gain maximum of the old design, and then reduce the reflector length to fit the new bandwidth. Some further optimizations could probably also be made.

Some years ago I designed an OIRT version of my 15.11 FM antenna design. It started out as a modeling experiment, but one German DXer actually ordered the antenna, so one was built and tested with the help of Sven Jacobson. Naturally, it is a big antenna with a boom length slightly longer than my 19.3 FM design. I also wrote an article for the German magazine Reflexion about it.

> Now if only I could find a proven design for a 64-108MHz log periodic which would fit on a 78 inch boom and give decent f/b ratio

The gain of such a design would probably disappoint you…
BTW, there are ways to make yagis cover surprisingly wide bandwidths. I have designed some for 47-74 MHz and even 45-88 MHz.

Sorry to hijack this slightly.

How does the 9.2 perform on the OIRT Peter? Do I need to reverse the
beam 180 degrees for the OIRT frequency range?

Thanks

> How does the 9.2 perform on the OIRT Peter?

Theoretically you will still get 6 dBi raw gain, but antenne impedance will be lower and more reactive at OIRT frequencies, and you will be outside the bandwidth of the coax balun for FM, so in reality net gain will be less due to the losses involved.

> Do I need to reverse the beam 180 degrees for the OIRT frequency range?

Yes, F/B gets negative at OIRT frequencies except at the top of the OIRT band. The reflectors, and mostly the longer one in the middle, will behave somewhat like directors for OIRT…

Hi Phillip,

An omni will do a job of sorts (is it horizontal or vertical?) but you will get MUCH better results with a yagi (even a 3-element) and a rotator. It will give you extra gain and directivity, and the ability to reduce signals in unwanted directions.

HTH

Jim.

Bournemouth, Dorset IO90BR.

8 element OP-DES yagi at 22-32ft, wideband vertical, Perseus SDR receiver with FM+, Funcube Dongle Pro+.

** Personal Skegness 'First'

The Es were close today but never close enough, and since meteor scatter was prevalent I concentrated on that. The Es season seems to have got off to a very good start again this year, but the main concentrations have been in central and eastern parts of Europe. Hopefully it will be the turn of the UK again soon.

Good DX!

31749. Mayak on 70.37 MHz?

Yahoo group: SkywavesDX (2014)
Date: 2014-05-14 10:24:57 UTC
From: Günter Lorenz
Topic: 31749 Message: 31749

Yesterday was a good Sporadic Es day. In the FMLIST logbook, I've noted this double-hop log:

Es 1039 70.37 RUS Radio Mayak, Severnoye (NS) 4156 km by Petr Pelikan, Cinovec (CZE) 0.6

There is no closer Mayak tx listed in FMLIST, but perhaps there have been recent changes or activations?
Voronezh is listed with Radio Rossii, and only 10 minutes later, Voronezh was logged:
Es 1049 73.55 RUS Radio Blagovestiye, Voronezh/G-Tsa Brno (VN) 1767 km by Petr Pelikan, Cinovec (CZE) 3.548 v

EB7CIN was on 50185 with a strong signal into London. EA7/EB7 indicates Andalucía and his QTH was Sevilla.

Nice little 6m Es opening this evening with Southern Spain/Portugal/Morocco worked and then the cloud shifted and Austria/Croatia/Slovenia went into the log.

Nothing special - just your regular springtime Es.

regards

Stuart

Finally some Band II SpE - and I was busy cooking the family's roast dinner!

Still I managed to capture MRC and ROU unattended with a nice catch on 87.8 from Morocco - as Medina FM is only 1kw - and distance over 2000 km.

Let's hope for a lot more in the days to come.

Hi Arvid.

It's definitely aircraft scatter. I am still receiving it now, fluttering in and out. The only possibility is NRK Petre from Bjerkreim. I presume my earlier reception of Greipstad (734 km) was aircraft scatter too but this hasn't reappeared, unless it is buried under Teutoburger Wald. I will keep an ear out for this to see if it appears again.

Good DX!

Hi Paul.

This is what I suspected too. I am sure I heard a vocal ID but I am having some problems with Camstudio and I think that recording was lost. When I eventually checked the web stream of Radio Sintonia a few moments later it seemed to be the same talk programme. I think there's too much uncertainty now so I will remove the logging.

Thanks and good DX!

John

Topic: 31761 Message: 31770

I would concur that this is RNE5. The female presenter at the start of the clip I have heard quite a few times on RNE1 & RNE5, the jingle at 00:51 sounds like that of the RNE news. Also there are two national news stories being covered, the 1st relating to the Luis Barcenas case & the 2nd to some sort of housing finance issue with Pamplona mentioned. I cannot hear any accents from the Canaries though. I checked the Radio Sintonia steam & the presenters do have local accents.

sleeper77, Southampton.

Thank you for listening to the clip Sleeper (Sorry, I don't know your real name). That sounds conclusive to me now that this was not Radio Sintonia. The log has been deleted. I will also update my blog.

Good DX!

John

** Personal Skegness 'First'

This morning's meteor scatter was done live. Bursts were frequent so it quickly became clear which stations or transmitters were coming through.

It seems that the morning tropo from Denmark and Norway was not tropo at all, but aircraft scatter, no doubt helped along by the high pressure, but it continued for the rest of the day, up and down, apart from the Norwegians, which fizzled out completely by mid-afternoon.

There was an enhancement come the evening, however, with Belgium and Holland increasing in strength slightly.

Good DX!

I think the problem was not FMLIST, but Firefox instead. I have continuous problems with Firefox, did another re-install recently, but this apparently did not help.
I changed to Chrome this morning, and then everything with FMLIST worked OK. Need to sort this out soon, I don't want to get stuck in the middle of a big Es opening.

I find that when I I am having problems accessing FM List I swap browsers. I usually use Chrome these days, but I also abandoned Firefox due to problems. Now it is going the other way around. Chrome is becoming a pain on both computers here and even closes itself and all other open Chrome windows occasionally. I might revert to Firefox again.

31779. TeamViewer Remote Access

Yahoo group: SkywavesDX (2014)
Date: 2014-05-16 10:20:33 UTC
From: John Faulkner, Skegness
Topic: 31779 Message: 31779

I have been trying some experiments with TeamViewer as an alternative to Ustream. This should be higher quality and without any real delay. It only had a fraction of a second lag when I was testing this with Nick last night.

http://www.teamviewer.com and login with user ID: 284684388. Today's password is xj356d. This is a simple and unobtrusive programme. No pop-ups, etc.

I currently have this set to "view" rather than giving full remote access in case numerous people log in, as used to happen occasionally with Ustream.

If you hear a whining noise on the lower half of the band it means I have my main PC active which causes some shocking interference at times, mostly on the lower half of the band. I need to replace the psu on this for starters as this problem is getting worse.

DX Robot has just gone off too so I hope there could be some Es on the way.

Cheers

John

We are running internal and external monitoring. FMLIST server has not been very busy, far from being overloaded, this morning.
Between your browsers and the FMLIST server, there is still the internet, which may be crowded from time to time.

So, let's all hope for the E skip to show up! Statistically, we should get a lot of it in the next 7 days.

73,
Günter

Hope nobody fainted or cried "foul!" :)

I'm currently in Biratnagar, Nepal. The Es here started on 11th and continues. Just the earlyish mornings so far. All of the FM has been from China, which is difficult to ID seeing as I don't speak Chinese. I've also had minority languages on 88.0 and 88.1 which are probably Kazakh or similar from Xinjiang Uyghur Autonomous Region.

Unfortunately internet access is difficult at the moment so can't upload clips. I've recorded everything I've received so far.

Hi

When I came back from work around 6PM localtime, there was "KOSSUTH" on my lounge hi-fi, parked since noon on 87.6.

This cheap hi fi (Philips MCM760) is linked to an indoors ribbon antenna (about a yard and a half of translucid plastic stuck on the bookshelves), it has the advantage of retaining RDS inscriptions hours after the skip happened, it is like stored in memory; excellent when you go out and you expect a skip will happen while you're away.

If you press the rds function other messages might appear too, in today's case a SMS number scrollling .

There were some Hungarians and Slovaks on the 6mb too but it soon vanished.

That sounds really exotic Ruud. All I can find is a high power Quran tx in Buraydah, Saudi Arabia. And if you plot it on a map, you will find ALB being exactly half way this location. So who knows, it might have been this one.

Wow an intriguing log Ruud! I did wonder if there was double-hop about, especially as John mentioned hearing a couple of Arabic-language signals in the chat. Nothing noted here though.

Fingers crossed we do get some confirmed double-hop logs this season.

Good DX.

Nick, Whitchurch, Hampshire.

31798. UNID RECEPTION - HELP PLEASE

Yahoo group: SkywavesDX (2014)
Date: 2014-05-16 20:44:30 UTC
From: davebunyan@...
Topic: 31798 Message: 31798

A lot of activity today with good Tropo between 0600 and 0800UT,, OIRT FM Band 13:00 to 1405 UTC and then Band FM from the Balkans until 15:30.

I was receiving TV sound around 65.75 MHz - the spectrum display indicating two carriers - one at around 65.74 and one around 67.75 and seemed to be the same program (?)

I recorded 4 minutes or so from 1304UTC - can anyone identify it from the clip attached? My suspicion purely from what else was being received is Novyy kanal from the Ukraine - but I can't identify the language - souns Italian to me

It sounds like Romanian to me. I *think* Moldovan is a dialect of Romanian so yes I would agree with Arvid.

Good DX.

Hi Ruud

Was there any RDS data streams i.e. if you click on RDS can you see the 2 lines?

BTW: If you open the file in HDSDR you can see the full width signal.

Andy.

Groetjes Ruud ! "Sounds" one hundred percent for me like this:

http://www.radio-hitz.com/Arabic/radio_quran.htm

http://alquranradio.net/

Like Janpeter alreaydy suggested..

good nite, three hours sleep then watch NHL LA Kings visiting Anaheim (we have few finns there..)..
Hannu

31803. Re: [SkywavesDX] UNID RECEPTION - HELP PLEASE

Yahoo group: SkywavesDX (2014)
Date: 2014-05-16 21:44:49 UTC
From: davebunyan@...
Topic: 31798 Message: 31803

Thanks to both of you - that fits in with my observation that there were two transmitters with the same program on 65.74 and 65.75 as this is what FMList shows:
Frequency Power ITU Reg Program Location
65.739583 10.9 MDA SG @ TRM M1 Bălți / Mîndreştii Noi
65.75 0 MDA UN @ TRM M1 Balanesti

The RTL-SDR dongle is extremely useful in this regard despite it's limitations as far as overload is concerned and I had only calibrated it against various UK stations across Band 2 two days ago when I uploaded the latest version of SDR# so I know its accurate to the kHz.

101.7 1424 ? UNID, "Arabesque" said as if ID or programme name.
Exotic sounding. Thought it was Arabic at one point.

** Personal Skegness 'First'

I had to go out this morning and missed most of the opening. I wathced
remotely, helpless as TeamViewer software just froze while Bulgaria was
coming through. This was extremely annoying. After several attempts I
finally managed to get CamStudio (I hate it with a passion) t record
what was coming in on 87.6. An hour or two later, still connecting
remotely, I stopped CamStudio to save the file. Of course it crashed and
I lost the lot. So I swore (I did, believe me!) that I would invest in a
full and registered version of Bandicam, so I did. That's the last time
CamStudio messes up my DXing!

Luckily, my return home saw the Es opening still in progress and it was
a decent top-of-the-band opening to the Balkans with quite a few
personal firsts, some of which were less than 1kW. A bit of detective
work solved most of my unids, though a few remain. Signals were very
good, reaching 50dBf at best, without RF or IF boost!

*
I made a YouTube video of the highlights at:
https://www.youtube.com/watch?v=7O4H8gZKkr0 There were a few interesting
station in there, notably:**
**
11:28 92.5. Mono unid language? PI 3417. Partial PS 92_____
15:44 89.9. ??
**18:23 101.7. Arabic or similar? **
31.19 90.7 Arabic?
**
**The times above are references to the position of the video. Actual
times are displayed in the GTK window. *Help with these would be really
appreciated.

Good DX!

Hi John.

As it's late I have just listened to your UNIDs:

92.5 - sounds like Turkish to me. The PI code also suggests Turkey.
89.9 a Balkan language perhaps, maybe Serbian?
101.7 maybe Turkish Arabesque music. There's a Semerkand Radyo listed on 101.7 from Canakkale in the NW of the country. Would they play this type of music though?
90.7 not sure but possibly Turkey again?

It sounds like it was a very good lift there!

Good DX.

Nick, Whitchurch, Hampshire.

Hi Nick.

Thanks for listening. I think my 101.7 is the Balkans as there was definitely a Balkan language at 20:22, indicating a programme called "Arabesque". I wouldn't know the other languages and still wouldn't recognise Turkish if I heard it.

Knowing my luck with double hop the other's are probably just Balkan stations with specialist programming. Or ... it was interesting to see the number of mono transmissions around the time of the above loggings, some with appalling audio quality. We need the GTK software to analyse the distance of the received signal - if only that was possible :O)

Thanks again.

John

Yes, it was a good one Ruud.

Some more on my 92.5 - sounds more promising. Vlad Titarev on Real DX says the language is Turkish. It doesn't look like there are any Turkish language stations (as far as we know) on 92.5 in the Balkan area. Plus the PI of 3417 would suggest this was Turkey. So far I haven't located a 3417 anywhere.

As you will remember, Turkey is on my list of wants because it's just that bit too far for a single hop from here. The boundary always seems to stop abruptly at Bulgaria and Greece at around 2300km. Odd that this is different to the south though where Moroccans can come in at 2600km+, but I always suspect that those are helped along by tropo in the area.

Good DX!

It is also stunning how empty your FM is.
Like at Mike Fallon his qth its almost empty comparing with here !!
Now I understand your receptions are all clear audio and with RDS because of no QRM !

It's one of the reasons I moved to Skegness Ruud. Not the most important of course, but I love DXing and I confess I am an addict.

The mb21 shows how clean the band is here: http://tx.mb21.co.uk/mapsys/google/vhfanalogueNetworkRadio.php It's almost as quiet as the north-west of Scotland for empty FM frequencies. Here's a spectral scan i did of the FM band a few weeks ago: http://skegnessdx.blogspot.co.uk/2014/04/fm-band-spectral-scan.html

I think my 101.7 is
the Balkans as there
was definitely a
Balkan language at
20:22, indicating a
programme called

"Arabesque". I
wouldn't know the
other languages and
still wouldn't
recognise Turkish if I
heard it.
>
>Knowing my luck with
double hop the other's
are probably just
Balkan stations with
specialist
programming. Or ... it
was interesting to see
the number of mono
transmissions around
the time of the above
loggings, some with
appalling audio
quality. We need the
GTK software to
analyse the distance
of the received signal
- if only that was
possible :O)

31816. Re: [SkywavesDX] Skegness Log: 16-05-14

Yahoo group: SkywavesDX (2014)
Date: 2014-05-17 18:02:23 UTC
From: John Faulkner, Skegness
Topic: 31808 Message: 31816

I just discovered that YouTube have blocked the audio of this file in
certain countries, so I have made the file available at:
http://www.mediafire.com/watch/0a37ucvtvnxvotv/Sporadic_E_-_16-05-14_(JF).mp4
in case anybody is having difficulties.

I just don't understand why YT block some videos and yet still allow
countless pop videos to remain untouched on their site.

Cheers

John

31817. Meteor Scatter DXing Article

Yahoo group: SkywavesDX (2014)
Date: 2014-05-17 22:03:14 UTC
From: John Faulkner, Skegness
Topic: 31817 Message: 31817

After five months making it, I finally decided to scrap the video I was putting together which demonstrates the procedures I use for my meteor scatter DXing. This is now a text article at:
http://skegnessdx.blogspot.com/2014/05/meteor-scatter-dxing-different-approach.html

I just amended it after being asked to include some of the original video, which is of very poor quality, but you should still be able to see how everything works. I have been almost inundated with requests from other DXers, asking me how the system works, so I hope this will be of interest and of use. Comments welcome.

Cheers

John

Nice!

What you need to finish off that solution is a program to automatically traverse your meteor recordings and for each signal found find the corresponding audio waveform(s) in the recorded streams.

Thanks for sharing.

Andy.

Thanks Andy.

That's a very interesting idea. As I am sure you will know, that technology already exists with software such as Shazam, which I actually use quite regularly. We just need somebody to write the software for us MS DXers ;O)

** Personal Skegness 'First'

The briefest of brief sporadic E openings on FM today, plus a new station on 103.9 for me via scatter - not sure why I haven't heard this one before.

My gut feeling for the 103.4 transmitter of Joe FM is Genk since this transmitter comes through well on several other frequencies, but impossible to be certain.

Good DX!

Hi all,

what's the average percentage of MS bursts reaching RDS level at your respective places ?

Thanks

pat

An excellent video John from DXers paradise as I missed this opening.

Regarding Youtube your not alone I have just had one taken down after it had been up there for 2.5 years.
This seems to be a pattern videos up for a few years and then they start cribbing anyway they know best.

I have been thinking about an alternative so I can tell Youtube where to go.

Andy

I just discovered that YouTube have blocked the audio of this file in certain countries, so I have made the file available at: http://www.mediafire.com/watch/0a37ucvtvnxvotv/Sporadic_E_-_16-05-14_(JF).mp4 in case anybody is having difficulties.

I just don't understand why YT block some videos and yet still allow
countless pop videos to remain untouched on their site.

Cheers

John

Hi Patrice.

A very small percentage unfortunately.

Very few meteor bursts are strong enough to give RDS. Even when they are there can be mixing of signals which will hinder the displaying of the RDS. I'm sure there will be other propagational effects which will spoil this too.

I have seen signals as low as 14dBf produce full RDS, but also signals in the low 30s dBf NOT produce signals - from stations which use RDS. Over the last week I have seen meteor bursts as strong as 40dB, but more often they are around 20dBf.

If I were to give a percentage of bursts which produced RDS it would be very low. Well below 1% of all bursts received.

John

31840. UNID from last night's Es - Western Sahara?

Yahoo group: SkywavesDX (2014)
Date: 2014-05-20 06:54:59 UTC
From: Jim Smith G0OFE
Topic: 31840 Message: 31840

Hi all,

Caught my first half decent Es opening of the season last night.

I will have more UNIDs from this one (I have a feeling some PIs may have changed from last summer..) but the main mystery is this:

1800 -ish 88.0 PI:1000 ; PS I got "MFM **** Escuchas John "

I assume it was a "Now Playing" as a John Newman track was playing. Before that was another dance track and what sounded like Spanish talk/ad/jingle.

The only PIs of 1000 on that freq listed on FMLIST are from stations in Norway and Greece and it's neither of those as the band was open to part of Spain and North Africa.

One suggestion I have had it that it may be from MFM Sahara from Boujdour in Western Sahara, however this is a 1kw vertical TX, and FMList says it's an Arabic station, but there is nothing else listed that it might have been. I am rather sceptical.

I'll post an audio clip later, but in the meantime any pointers would be appreciated.

Bournemouth, Dorset IO90BR.

8 element OP-DES yagi at 22-32ft, wideband vertical, Perseus SDR receiver with FM+, Funcube Dongle Pro+.

Bournemouth Weather online: http://www.g0ofe.com/weather

I've solved this one now.

Had another listen with a fine tooth comb.

I heard an ID "MegaParty" and squeezed a PS "Mgaparty" and a search reveals that it's MegaParty from

Benitatxell, JM08 grid.

I didn't really think it was MFM Western Sahara, to be honest!

Jim.

From: sniffingmoose@...
Topic: 31831 Message: 31842

Hi Tim

Maybe the authorities have put them off air. Good news.

The strongest Westmidlands pirate here is HOT 92 on 92.0 here in Burton on Trent.

Also Kriss 95.1 seems much weaker nowadays sometime cant hear it all. It used to be so strong I often wondered what high power they were running. Anyway this one is clashing with enhanced Radio Oxford today.

Also I am hearing a new one on 90.0, very strong but no RDS and mono. Cant identify no DJ just endless boring techno music!

I guess they don't realise that with only slightly improved conditions, Wenvoe and Oxford comes in quite strong in the higher parts of the Westmidlands.

Also I cannot hear have the low power legal 89.1 Big City Radio as enhanced Wrotham is nocking it out today.

Hello Juan Antonio,
Nice logs !
Can you help me with 2 Spanish unids see screenshots.
88.7 station with quick changing PS; strange PI code for Spain (not starting with E but 9!) and PTY= Sport!
92.0 COPE probably from Madrid area with new PI code (acc. to FM list).
Tnx.

E0F0 is Spektra FM from Torrent (VAL-V), logged here with this PI on the
19th. FM List has it as E234.
>
> 88.8 PI: E039 PS: ADVENT.
>
I am guessing this is SER from the PI code. SER Arcos Del La Frontera
(AND-CA) is listed, but I cannot account for the 'ADVENT' bit.

John

Almost certainly both Spanish.

From: Jim Smith G0OFE
Topic: 31863 Message: 31865

Thanks John.

Rats - for E039, read E021. Been a long day!

88.8 PI: E021 PS: ADVENT.

Jim.

Bournemouth, Dorset IO90BR.

8 element OP-DES yagi at 22-32ft, wideband vertical, Perseus SDR receiver with FM+, Funcube Dongle Pro+.

On 21/05/2014 20:36, 'Jim Smith G0OFE' radio@... [SkywavesDX] wrote:

Having been through my recordings from Monday night's opening now, I have a couple of UNIDs to solve:

87.5 PI: E0F0

E0F0 is Spektra FM from Torrent (VAL-V), logged here with this PI on the 19th. FM List has it as E234.

88.8 PI: E039 PS: ADVENT.

I am guessing this is SER from the PI code. SER Arcos Del La Frontera (AND-CA) is listed, but I cannot account for the 'ADVENT' bit.

John

Almost certainly both Spanish.

If anyone has any pointers, I would be grateful.

Jim.

Bournemouth, Dorset IO90BR.

8 element OP-DES yagi at 22-32ft, wideband vertical, Perseus SDR receiver with FM+, Funcube Dongle Pro+.

88.8 has Radiole, Arcos de la Frontera (AND-CA). ??? Listed PI is E278
but Radiole have also used E012. This PI is also used by Romanian
stations. Was the band open in that direction at the time?

"Ooooops" time: Seems I got the site wrong before, it's Radiole which is
listed from Arcos de la Frontera, not SER as I said before. My eyesight!
Totally unreliable. Apologies.

Sorry for any confusion. Somebody else may have the answers, but
hopefully this will do for starters. I fancied doing a bit of detective
work. Perhaps I should sit back and let the experts do this. ;O)

A big opening this morning. It started early at about 01:20 UTC (07:05 local). I was able to monitor for more than two hours before I went out.
Here is the raw video footage whilst tuning around. (simply editing by using my Nokia mobile phone's "pause")

FMDX Es from China-six videos

Tecsun PL-606/Wave Jack antenna used indoors. (5 videos)

Sony ICF-SW7600GR/ Wave Jack mounted indoors (1 video)

31876. Morocco: PI code changes for SNRT

Yahoo group: SkywavesDX (2014)
Date: 2014-05-22 14:39:40 UTC
From: Günter Lorenz
Topic: 31876 Message: 31876

From the first Es logs I note that SNRT has changed the PI codes of their networks.
Well, finally they got it right, conforming to the RDS specification ;-)

The old codes (1001, 1002), having a "0" at the second position, actually indicated a local, single-frequency station. Any compliant RDS receiver would not look in the AF table for such a PI code.

The new codes (1201, 1202) now correctly indicate "national" frequencies ("2" at second position).

I've generally changed these two codes in FMLIST. We'll certainly collect more changes in the next days.

73,
Günter

31878. XDR i2c Modification & Thunder Storms

Yahoo group: SkywavesDX (2014)
Date: 2014-05-22 17:05:27 UTC
From: John Faulkner, Skegness
Topic: 31878 Message: 31878

We have had storm after storm pass between here and Boston today. Still going off now. Some of the rumbles sound really angry, like bombs going off in the distance.

I was keeping a mental note of the strength of the static bursts and I didn't see anything stronger than 51dB. Belmont reaches up to 70dB here so I didn't think the static at 51dB would be anything to worry about.

Then the audio from the XDR started to produce a sizzling sound, corresponding with a prolonged series of lightning flashes, which didn't seem particularly close. The display registered 31dB, from memory. It's all caught on video anyway. Then the audio disappeared, the XDR still apparently active. After trying to revive it a couple of times it sprung back to life. I have now unplugged,unfortunately in the middle a fairly impressive Es opening and will wait until the storms have passed. There was a very close blast not long after I unplugged too,

We have also had brief power outages here, so I wonder if this might have had something to do with the sizzling effect and the resulting switching off of the XDR.

I think the motto is, those of us with the i2c modification, make sure you unplug your aerials during thunder storms.

Hi

Some new stations for me, my first massive E this season, which took some time boiling up starting with ALG and TUN on 87.6

only new stations are listed here :

88.9 Radio Comercial, Minhéu PI 8203

90.2 Portuguese, suspect Renascença Guarda

94.9 Portuguese, suspect RDP1 Minhéu

94.0 80CC Radio Dom Bosco Lamego (Comercial Lamego was audible same time 88.7 PI8203)

92.2 E4E1 Radio Gallega Musica , nothing on FMLIST, maybe 92.1 Monte Meda but RDS was on 92.2

94.8 NFM PI 8446 Radio NFM Bombarral

88.0 Portuguese suspect RDP2 Minhéu

95.2 Portuguese, suspect RDP1 Serra de Marao

then one from Spain

92.2 E4E1 Radio Gallega Musica , nothing on FMLIST, maybe 92.1 Monte Meda but RDS was on 92.2

I listen to the news at 20 UTC and exactly the same female was saying Radio Travel.
It's very unique that 87.7 is in use now in ALB because acc. FMlist the 1st used frequency is 88.0 MHz.
Long time ago we could hear the audio channel of the analogue TV transmitter from Tirana at 87.75 MHz.

Nice job Dave :-)

I also had this station at around the same time, as well as Austria and Serbia on 88.7. There were quite a lot of strong signals from this sort of area for a short time until Italy took over everything. Until you posted this, I was beginning to wonder if I was the only one who had the opening to central Europe & the Balkans as there were no logs from this area on FMLIST.

Good DX.

Nick, Whitchurch, Hampshire.

Yamaha T-2, Denon TU-800L, Kenwood KT-1100SD (modified), Yamaha T-85, Sony XDR-F1HD tuners, Triax FM5 horizontal beaming east.

** Personal Skegness 'First'. Underlined stations are unidentified.

The first good Es opening of the season, starting with fleeting appearances of Spain around midday. Portugal and Morocco soon followed. Then there was a decent opening into Algeria with a few new ones. Italy popped up late afternoon and then there was a good opening to Tunisia.

Italy reached an impressive 67 dBf at 1729 courtesy of Radio Globo from Ercolano-Vesuvio on 88.4. This is the strongest signal I have observed so far with the GTK software. Again, no boost was used.

I thought I might have had Libya once or twice while Tunisia was dominating. 87.9 and 97.7 had Arabic stations which did not seem to be from Algeria or Tunisia. I ruled them all out with web parallels but, as luck would have it, the Libyan web streams did not work.

Good DX!

Topic: 31894 Message: 31894

During a short opening into Istanbul area I found at my recording a over modulated male talking.
In FM narrow the audio was not good so I have to go wider but still no good quality.
Any idea about the language?

Ruud

Yes it looks like Turkish but there was almost no fading like the Istanbul stations had
 and that is an indication it was coming in via another reflection path.
Also the very loud modulation isn't common for Turkish stations but more like LBY and LBN countries.
Again a unid which never will be solved?

Was it just Istanbul that was coming in with this signal or were there other more interesting signals? I have no idea whether it was the same station or not but I had an UNID Turkish station on 87.8 last year, in late August of all times:

https://app.box.com/s/5r5r2gn7l4pbpuamuvgs

Just before this Radio Dalmacija was on the channel (and I think it fades in again on the clip). Kurt in Istanbul heard it but he couldn't ID it.

Good DX.

It must be Avtoradio, Aleshnya, Bryansk region.
Unecha, Novozybkov are parts of Avtoradio's network in this region.

Hi,
I just noticed this thread as Hannu Piirainen gave me a hint. The same problem has been pestering a few of the units that I have modified here in Finland. I haven't made any notes but it seems to be more common with the later production radios, S/N starting with 9 or 0. Last week it came up again with Harri Kujala's remote setup and I took a closer look. Now I believe I have a good explanation and cure for the problem.

The problem is caused by the method of controlling the radio with the reset line. When the internal controller is in reset state it puts all it's control pins in high impedance state. This means that the control pin voltage tends to float towards a value that is determined by the other circuitry that is connected to it. It also means that external RF interference or powerline hum may cause erratic behaviour. You can test this by touching the DTUNER_PWR control line (W1 pin3 or jumper JW25) with a probe or screwdriver. The external RF and 50Hz noise will switch the power on and off at random and cause bad audio noise.

DTUNER_PWR is the control pin that is used for standby/on state control. In standby state it switches off the voltage regulator chips for RF and AF modules. It seems that the "floating voltage" of these regulators is too low when they are cold and it causes them to switch off. When warmed up they tend to pull the voltage slightly more up and start working again. The diode mod uses the same DTUNER_PWR pin and adds enough pull-up to make it working.

There is an easy way to cure this. Add a pull-up resistor to the DTUNER_PWR line that will keep it in a stable "on" state when the processor is in reset. Easiest place is between jumpers JW25 and JW21, close to the interconnecting flat cables. 150kohm seems to be a suitable value.

Hope this helps,
Arto Harjula, OH2BGN

---In SkywavesDX@yahoogroups.co.uk, <satnipper@...> wrote :

I have to have the XDR switched on for a minute or two. If you do the diode
mod as well that overcomes the issue.

I don't fully understand the comment about the FE pre-amp. Surely that
connects to the XDR's antenna input and the PC connects by USB through the
SEED board to the XDR? The SEED board connects to the control circuitry -
not the RF circuitry. Unless something weird is going on and the control
circuitry checks the RF input for something (?) and the FE pre-amp is
somehow blocking that? Is the pre-amp under power when you try to connect?
If it isn't maybe that is the issue?

Cheers

Stuart

Subject: [SkywavesDX] XDR-GTK Oddity

I thought I would have a play with my Fringe Electronics pre-amp this
morning, but the XDR-GTK software seemed unable to run the XDR at first.
After a while I discovered that I had to have the XDR switched on for around
fifteen minutes before I could activaye the XDR-GTK software and control the
XDR.

With the XDR connected to my main computer, the switch-on duration is about
fifteen seconds before the XDR GTK software will run it. The laptop takes
much longer for some reason - about three or four minutes.
But with the pre-amp inline on the laptop this increases to a ridiculous
15+ minutes. So why is there a such a huge difference in these times? I
don't understand why the pre-amp has this effect.

John

https://www.youtube.com/watch?v=TVBq9p89TQI

Can any Arabic speakers listen to this recording please.

I have already heard that the language of this station is Arabic and that there is an ID in here (I thought I heard one myself 2'19" into the recording -15:17:04 actual time).

I am seeking confirmation of this. I had this down as tentative Radio Ouargla from Algeria.

Thanks

John

Hi John,

This is Radio Ouargla, no doubt about it. There are two clear mentions of Ouargla at 2:31-32.

Samir.

Hi David,

How's the concentration working for you, so far?

As I have gathered, today should be the peak one, as to M-S. Somewhat
lowish it has sounded, to me.
I believe, the origin is the constellation of the Dog, not that of the Lion.

I did mean Algeria (and I corrected that from "Morocco" again, would you believe. I am "all over the place" at the moment. I hope this isn't a sign of anything serious but my levels of concentration are terrible lately. No reason for it, maybe I am just excited about the sporadic E ! :O)

I will try and record all my DX on video now, just in case there are any discrepancies.

Thanks again Samir.

31921. The Camelopardalids

Yahoo group: SkywavesDX (2014)
Date: 2014-05-24 09:04:32 UTC
From: John Faulkner, Skegness
Topic: 31921 Message: 31921

What a long name!

We drove into The Wash last night (not literally, we would have got wet) at local midnight in the hope of seeing the /potentially/ spectacular Camelopardalids meteor shower. We were armed with folding camping beds for comfort, plus quilts as temperatures can drop quite cold around there.

Skies were 'clear enough', but not as clear as they usually are, for instance the Milky Way was not visible due to slight sea mist. After looking up to the skies for about half an hour we saw only one meteor and decided to give up and go home.

Here's what The Guardian newspaper had to say about the Camelopardalids.

"The analyses indicate that the resulting meteor shower should peak between 07:33 and 08:49 BST on that morning (May 24th) with rates of about 100-400 meteors per hour, though a storm-force display of more than 1,000 per hour cannot be ruled out. Since we have no data on the comet's activity a century ago, the estimate is uncertain and, indeed, _there may be nothing to see after all_."

Other articles suggested that North America was the prime place to see the Camelopardalids.

Maybe it will be worth checking again tonight, knowing that these predictions can sometimes be as much as a day out.

I recorded 87.6 overnight and after seeing the resulting wav file this morning I can say that there were _a __lot_ of radio meteors. Radio Impuls 87.6 has appeared twice while I have been typing this.

Good DX!

John

31922. New Personal Scatter Distance Record

Yahoo group: SkywavesDX (2014)
Date: 2014-05-24 09:43:03 UTC
From: John Faulkner, Skegness
Topic: 31922 Message: 31922

Band 2 General Scatter:
107.6 0826 D Antenne Th?ringen, Remda (Saalfeld) (th?) Ads, ID and pop song. First time via scatter! 788km

Can't believe I forgot this one from yesterday. This was received via scatter and becomes a new record distance for me via this mode. I don't have a video to show but the identification was heard and the reception was also confirmed by checking the songs heard against the station's web stream. I will gt a video next time as I am sure this will reappear in the near future. Antenne Thuringen can be heard peaking noise free on scatter when visiting Kenwick Top in the nearby Wolds, bridging a distance of 817 km (508 miles).

Good DX!

Hi all,

Once again we have remote-FM-SDR-receivers in distant Utö-island in SW Finland. http://remote-fmdx-uto.blogspot.fi/ http://remote-fmdx-uto.blogspot.fi/ Not so nicely finished but it works.

We had this same equipment installed to Medium Wave till February 2014, but

the longwire-antennas and coax cables were totally destroyed by forest-works

in the end of January (by the forest owner).

http://mwdx-karvia.blogspot.fi/ http://mwdx-karvia.blogspot.fi/ Lets see if there will be a re-installation.

** Personal Skegness 'First'

A slow, teasing and slightly disappointing opening, but still nice to have some Es. It was one of those opening which felt like it took a long time to hear very little.

My logging of an unidentified Arabic station on 90.0 is interesting. The PI code, D311, was correct, according to the software - in other words there was no question mark next to it, so error checking would have been done. I received a suggestion that this might be Libya. Is "D" their prefix? I cannot find the RDS Country Code List which used to be available on the internet. It seems there are a few Libyans using RDS now.

Good DX!

Hi Ced,

very very nice!

88.0 is from Greece. All "D" PI codes are from Libya. To answer John's question, yes. D is their prefix. All RDS prefixes can be found in FMLIST on the "Countries" page.

73,
Günter

Thank you G?nter.

I missed that completely! Quite surprising as this evening's opening seemed quite bland. I certainly never expected Libya to pop up going by the conditions.

Next is to find out the location of the transmitter. I see little is known about this one, but the FM List entry appears under the ES (n) tab and not the usual "Es (700-2700)".

Thanks again!

John

31948. Video of this morning's Es

Yahoo group: SkywavesDX (2014)
Date: 2014-05-25 16:20:15 UTC
From: John Faulkner, Skegness
Topic: 31948 Message: 31948

http://youtu.be/uqDlhduKg3o

This morning's opening had an interesting ending. Romania and Bulgaria were coming in to fair levels, but the opening was moving away to the east.

The last few minutes produced a few interesting sounding stations which I was hoping might have been Turkish, but I was not aware of the full extent of the strangeness of this until the very end, when an Arabic station appeared on 87.5. It has been suggested that this might be Palestine, but there is no way of knowing. The weakness of the signals also made me wonder if this was double hop.

I will never know, but have a listen and make of it what you will.

Sorry about the whining noises, particularly noticeable at the bottom of the band at the end of the video. This is the interference my main desktop computer causes. I don't think it's the power supply.

Good DX!

John

Forget it - YouTube are a waste of time. Don't bother with them. They muted the entire video "due to a copyright claim before it was even fully uploaded! . GRRRRR!!!!!

Anybody know any good alternatives to YouTube where they don't enforce ridiculous rules?

John

31965. Jurgen's StationList

Yahoo group: SkywavesDX (2014)
Date: 2014-05-26 12:46:39 UTC
From: John Faulkner, Skegness
Topic: 31965 Message: 31965

I have been having a play with Jurgen's StationList recently and can see some positives in using this, but a few points come to mind.

So StationList can be used to create a logook which can be uploaded to FM List at a later point.

Firstly, I run the programme. In my case I am not using StationList to control hardware but I understand I need to select "Control FM+" in the file menu.

Example: A station is coming in on 87.6 MHz and I want to log it. I use "CTRL+K" to select the frequency. (For some reason this doesn't work on my desktop computer - it DOES on the laptop however).

Then a "CTRL+F" will help me search for the station or PI code, etc. Then "CTRL+right mouse click" brings up the menu to add the station to the logbook.

Is there a way I can TAB between the logbook and the database window? I would like to add comments, i.e. the RDS info, into the log itself, at the time of adding the logging to the log window. I do not see the point in logging the station without some helpful information about what I heard or including the RDS data. It seems that once the logbook window is open you cannot go back to the database window.

If there are several stations using the same name/PI code on on frequency, how can I select them all when conducting a CTRL+F search? It seems that it would be easy to miss identifying the correct site of a station if only one of them appears in each search.

Thanks

John

Hi all.

A few recordings from Es openings, from May 16th and May 22nd:

May 16th:

https://app.box.com/s/0ljz90s9jnt966yxqu3b - 87.6 BNR Horizont (edited in the middle to cut out a spell with no signal)

https://app.box.com/s/pfchpzncz6njub9b2dgq - 92.2 BNR Hristo Botev + unid station xfading at times
https://app.box.com/s/kkwcglidi2hcyi7epe2e - 91.6 Radio Fokus, Serbia? (can't find this in FMLIST)

https://app.box.com/s/le0j0jzpxmwy65ezzk1n - 91.2 OE 1 Graz presumed + unid Balkan

https://app.box.com/s/wqf4upmwrbvm652z1tw0 - 103.2 Radio B 92

https://app.box.com/s/jm6x1jy08esuuh9eyveg - 88.9 unid talk (Beograd 1?) + Radio Index

May 22nd:

https://app.box.com/s/89rufluw098ohwfscth7 - 102.5 AFN Rota (interesting how stable the signal is for the first 2 or 3 minutes, like tropo)

https://app.box.com/s/vlkqvdvg7fvwxrt77glt - 87.8 Radio Slovenija Val 202 (I know Dave in Brighton received this around the same time)

https://app.box.com/s/xzdneow33querohh83nv - 88.7 Bayern 2 presumed then RTRS Radio Republike Srpske (autonomous republic within Bosnia & Herzegovina)

https://app.box.com/s/0g6q0cdmxdoipei8q6tv - 93.7 Radju Malta presumed - is this Maltese? (received on the Yamaha T-2)

Good DX.

Nick, Whitchurch, Hampshire.

Yamaha T-2, Denon TU-800L, Kenwood KT-1100SD (modified), Yamaha T-85, Sony XDR-F1HD tuners, Triax FM5 horizontal beaming east.

Hi Nick,

93.7 Radju Malta presumed - is this Maltese? (received on the Yamaha T-2)

yes, thats Maltese.You'll note some Italian and some Arabic sounding words. But best of all, you've got a nice ID at around 04:10 in the clip!

88.7 Bayern 2 presumed

Yes, Bayern 2.

91.6 Radio Fokus, Serbia?
Thats one for Amos. Frequency not mentioned on http://www.fokus-radio.rs/
BEOGRAD 101.4 MHz VOJVODINA 88.7 MHz 93 MHz 95 MHz 99.5 MHz 107 MHz 107.1 MHz ZAPADNA SRBIJA 100,5 MHz ISTOČNA SRBIJA 102 MHz CENTRALNA SRBIJA 88,5 MHz 91,1 MHz 99,8 MHz 104,1 MHz 105 MHz 107,2 MHz JUGOZAPADNA SRBIJA 107,6 MHz JUŽNA SRBIJA 105,6MHz 106,5 MHz

So it seems "Radio Fokus" in FMLIST SRB is now "Fokus Radio", at least on 104.1

73,
Günter

Fascinating to hear these exotic signals in the UK Peter. :-) The station on 89.6 with the YL seems to have several IDs which sound like "Now FM" but it's probably not spelt like that.

Oh and two stations sound like they mention "Yoda". Are the Jedi Knights big over there? ;-)

Good DX.

Nick, Whitchurch, Hampshire.

Thanks very much Günter. I hadn't realised that there was an ID in the Malta recording.

Mike Fallon also received a Radio Fokus on 87.5 yesterday (see https://www.youtube.com/watch?v=MkE6DhoneJ4&list=UUclhK0FGmlXSMTuogKGBIgg) so perhaps they are swapping with old stations - 87.5 used to be Narodni Radio - or adding new relays?

Good DX.

Nick, Whitchurch, Hampshire.

Yamaha T-2, Denon TU-800L, Kenwood KT-1100SD (modified), Yamaha T-85, Sony XDR-F1HD tuners, Triax FM5 horizontal beaming east.

31974. Help with English language station on 98.8mhz

Yahoo group: SkywavesDX (2014)
Date: 2014-05-26 19:28:50 UTC
From: BEAVAN SIMON
Topic: 31974 Message: 31974

A bit of a long shot, but just wondering if anybody can help with a station I've just picked out of my recordings from 22nd.

The Balkans had come and gone and Italy was dominant and for only about 20 seconds a station faded up on 90.8mhz in English. It was not BBC Radio 3 which was playing music at the time and mixing with the English station.

The programme seemed to be about English in America and the "English Language Unity Act" and sounded very much to me like the old VOA special English broadcasts. Do VOA still do these (I thought I read they were dropping them) and if they do are there any Italian stations relaying them ?

Thanks

Simon

Hi Simon. I would guess it was HRT-HR1 from Kalnik in Croatia listed with 10 kW. I have heard English-language news on this station before, and also in other languages, presumably for tourists.

Their stream link url is http://provisioning.streamtheworld.com/pls/program1aac.pls if you want to listen and see if you can hear the same news reader.

Good DX.

Nick, Whitchurch, Hampshire.

Yamaha T-2, Denon TU-800L, Kenwood KT-1100SD (modified), Yamaha T-85, Sony XDR-F1HD tuners, Triax FM5 horizontal beaming east.

Thanks Nick. I'll have a listen.

It was a very short clip, but my impression was it that it was an actual program about the politics of the English language in the USA rather than just a news broadcast,

Simon

Hi Nick,

the german Language broadcasting on 91.2 is -for sure- OE1.

But, listening to the entire clip, at 2:01 I have heard "Lesnina, kvaliteta dosupna svima" and that's exactly the claim for croatian market of the chain of furniture stores called Lesnina.
On 91.2, the only croatian station is Otvoreni Radio from Osijek.

In fact, after a more careful listening, at 0:40 I've heard "Poslijepodne na Otvorena: tvoj feel good radio."

Hi Nick,

the german Language broadcasting on 91.2 is -for sure- OE1.

But, listening to the entire clip, at 2:01 I have heard "Lesnina, kvaliteta dosupna svima" and that's exactly the claim for croatian market of the chain of furniture stores called Lesnina.
On 91.2, the only croatian station is Otvoreni Radio from Osijek.

In fact, after a more careful listening, at 0:40 I've heard "Poslijepodne na Otvorena: tvoj feel good radio."

You must be the only one then. I don't assume it is always FM List which
is slowing, but more often this is related to local internet connections
or browsers. I think my problems are usually down to browsers. If things
generally become slow in Chrome I switch to Firefox and vice versa. This
usually solves any speed issues. Clearing the browser's cache seems to
help occasionally.

Don't we all these days. It doesn't work like that though. I still
cannot understand why YT allow so many pop videos and full length TV
shows and documentaries. Yet they grumble about ten seconds of Bulgarian
folk music. That makes no sense to me.

Thanks again Jurgen.

Good DX!

Nice opening today, and congrats to janpeter on the AOE catch - nice one!

I have a couple of (almost certainly Moroccan) UNIDs:

1731z 103.1 PI 1401

1750z 91.9 PI 1356

Any ideas anyone please?

Cheers

Jim.

During this afternoon's opening to Morocco, I heard an unidentified relay of Morocco's SNRT Quran on 99.4. This is unlisted. I don't suppose this could be from the Spanish Sahara, but there is a "HIDDEN" station listed in Laayoune. Or maybe it's just Morocco swapping their stations around again.

103.1 had two unidentified Arabic stations. One with very distorted Arabic or North African sounding music. The other, very weak, had snippets of what sounded like Arabic.

I made a YouTube video and IT UPLOADED WITHOUT BEING BLOCKED!!!!!

https://www.youtube.com/watch?v=nDUXlyhHKjs&feature=youtu.be

00:14:28: 103.1 (16:51 real time on the XDR display)
00:17:27: 99.4 (17:27 real time) This was // 98.6 and mixing another unidentified Arabic(?) station
01:02:12: 103.1 (17:39 real time)

Thanks

John

31993. Band II Sporadic E Loggings for 27 May 2014

Yahoo group: SkywavesDX (2014)

From: Janpeter van Dijk
Topic: 168 Message: 31993

Hi All,

A very exiting evening! The Es opening seemed to be just another teaser, with only very few weak signals at the bottom of Band II. Until suddenly some very distant Moroccan / Western Sahara stations made an appearance.
Never before did I have three stations at 2500+ km distance in one opening. Never before did I have something from AOE. Great stuff!

And shortly after this, Olivier Guillaume had some time to do the last bits and pieces to get my Sony modification up and running. Which was a complete succes.
A big big thank you to Olivier, who did a great job with enhancing the software functionality. With even more good stuff to come.

I think it has been my Onkyo tuner that produced this grande finale in style. A great tuner indeed, that has never let me down the past 25 or so years.

Best regards,
Janpeter van Dijk, Zoetermeer, The Netherlands.

Many congratulations to people in continental Europe, for your successes, so far this SP-E season.

Here in Lincoln, UK, Sporadic E has seemed almost non-existent, so far this year, with only very small snippets of activity.
Normally, by this date in May, we've experienced what I call a "rip-roaring" SP-E opening on both Bands I & II, but not this year.

I cast my mind back to last year, which was a REALLY good year for SP-E here in the UK, but people in North America had a very poor SP-E season.
Maybe it's our turn to have a poor one this year? :-(

Cheers,

Chris.

I agree Chris that it is generally a very slow start. But even then something like this evening can suddenly occur out of nowhere. So I guess we just have to keep monitoring the bands. Also, a good start to the season could end-up in a disastrous end. And vice versa fortunately.

73, Janpeter

A nice opening into Morocco with the Assa transmitter getting through on
a possible double-hop, or maybe getting a push with a bit of tropo
enhancement at the far end.

I got quite excited about the two stations on 99.4. One was definitely
an outlet of SNRT Quran, but from an unknown site. The station was also
briefly mixing with another Arabic sounding station, but there have no
clues as to who it might have been.

Topic: 31998 Message: 31998

I only picked up the tail end of the openings for Sun 25th and Tues 27th May - but had some nice low power catches - extract from log - and hope it formats properly when sent.

Date UTC QRG ITU Program name Location kW km Azi Remarks: 25.05.14 0844 88.7 ROU Kiss FM Focsani 0.298 2032 98 PI:515A 25.05.14 0852 89.5 ROU Radio Brasov Special Sacele 0.04 1934 99 PI:EA0C PS:SPECIAL 25.05.14 1015-1017 87.7 I Radio Venere (Puglia) Lecce 1 1812 126 PI:5D4A PS:----LO-- 27.05.14 1711-1714 87.5 E Cadena Nostalgia Dos Hermanas/Montequinto 0.1 1645 201 PI:90E0 PS:OSTAALIA 27.05.14 1712 87.8 E Onda Valencina Valencina de la Concepción 0.05 1640 202 PI:E011 PS:RV____FM

Notably Cadena Nostaligia was so strong the full RDS was picked up even though the tuner was sat on 87.6 and RDS Spy log had the following line:

2014/05/27; 18:12:05-18:12:42; 90E0; Outstanding; ; OSTAALIA; 0 %; Oldies Music / (27); RT A/0 = "CADENA NOSTALGIA SEVILLA 87.5 FM

Unfortunately for me I was away from the 'radio room' for most of the opening on the 27th - but had the tuners on 87.6, 87.8 and 100.5 and was fortunate enough to get the info on the RDSLogs.

Hi Jürgen,

> First of all: Congratulations on your 2Es logs Janpeter!

Thank you!

> This evening on a rather empty OIRT I got a surprise:
> 68.51 R.Rossii GTRK Kuban, Armavir (KD) 2540 km

And congratulations to you for receiving Armavir. It is remarkable how many 2500+ km distances have been received throughout Europe yesterday.

> 66.080 BLR BR Kanal Kultura , Svislach=Svislac (HR) 1049 km [pm]
> very odd that they use stereo pm and not the usual pt

Please forgive my ignorance, but what is stereo pm and stereo pt? Can you hear the difference or only see it in the waterfall?

73, Janpeter

Subject: [SkywavesDX] Band II Sporadic E Loggings for 27 May 2014

Hi All,

A very exiting evening! The Es opening seemed to be just another teaser,
with only very few weak signals at the bottom of Band II. Until suddenly
some very distant Moroccan / Western Sahara stations made an appearance.
Never before did I have three stations at 2500+ km distance in one opening.
Never before did I have something from AOE. Great stuff!

And shortly after this, Olivier Guillaume had some time to do the last bits
and pieces to get my Sony modification up and running. Which was a complete
succes.
A big big thank you to Olivier, who did a great job with enhancing the
software functionality. With even more good stuff to come.

I think it has been my Onkyo tuner that produced this grande finale in
style. A great tuner indeed, that has never let me down the past 25 or so
years.

Best regards,
Janpeter van Dijk, Zoetermeer, The Netherlands.

32010. ES to Albania - and help with UNIDs required

Yahoo group: SkywavesDX (2014)
Date: 2014-05-28 14:28:29 UTC
From: davebunyan@...
Topic: 32010 Message: 32010

While I was away from the radio getting lunch/doing some housework I left the Sony ST311 scanning a bunch of preset frequencies logging to RDSSpy. Would anyone like to help identify the ones listed at the end of this post - with the added challenge of only having a range of frequencies?

When I got back to the radio RDSSpy log was showing a load of reception had happened between 12:!2 and 12:25UTC.

Now RDSSpy as you know doesn't capture/control frequencies but a bit of detective work looking up the pi codes and Station names showed I had got a number of Albanian stations and based on the table of frequencies scanned I could positively id the following

PI: 5E0F PS: KLAN____92.9 MHz - which is Radio Klan Alabania - FMList says "no RDS"
PI: 5158 PS I_PA---- - which is Radio Tirane on 91.0 as it's the only listed frequency for my scan

During the same time period HRT_HR1 and R Dubrovnik from Croatia were logged.

But that leaves four unidentified stations - three of which are 'odd' - and I don't know what frequency they came in on - except they were within 87.6-87.9, 89.4-89.8, 90.4-91.1, 91.5-92.2, 92.7-93.1 with a couple of odd frequencies in between (avoids locals and local DX channels)

These are the UNIDs

PI:5320 PS:---------- which could be Alabania, Spain, Italy,Romania or Turkey - but not on any of the frequencies I scanned
PI:CCCC PS:NA__DN I - FMList only lists R Hayat from Turkey
PI:5000 PS:RDSTVR - it looks like the RDS encoder has been left on factory default as the RT/A gave the software revision, release date and company name.
PI:0000 PS:AL--NIA- which has to be ALbaNIA and according to FMList should be Radio Albania News but the only one listed is not on one of the frequencies scanned.

Any suggestions anyone?

Congratulations from me Janpeter excellent log.

I agree it's been a poor start and not helped by missing some openings so hopefully more good openings to come.

Thank you Andy,

Well, it is still early days. We have had seasons having a good start but ending in nothing. So I am assuming this year will be the other way around. Some Es are building now on OIRT.

Hi David I also received a station on 87.7 with a PI:5000 but the PS:RDSRVR this was displayed on both 311's and RDSspy.

This is my banghead moment I discovered I wasn't recording this and then later I realised that I wasn't recording that either doh!

** Personal Skegness 'First' via meteor scatter

A fruitful day, not just for sporadic E, but also for general scatter with some good distances acheived once again. The current pattern of the weather is one of low pressure and, since Denmark and Norway are now received almost every day when I check for them, I think I can conclude that they are definitely both being received by general scatter.

Two highlights for me were receiving Bavaria on Es. Most of the stations 'got away', with the exception of Bayern 2, Wendelstein on 89.5. The other was the reception of Radio Gardena in the Tirol/Dolomite region of Bolzano. This station is familiar to me as I stayed in the picturesque village of Ortesei Sankt Ulrich some years ago. I remember listening to several radio stations in this region, some of which I *think* were broadcasting in the Laden language. There was some unusual language around the time of this logging and more can be heard on my video at: http://vimeo.com/96703804. Maybe there are even a few more stations in there I missed (hint, hint ;O)

Good DX!

Wasn't this the PI of Kiss Norwich?

> 90.2 1118 ? UNID, D201. Libya? Radio Msallata has this code

As has K4 from Goles in Kosovo. Given the language you had this one.

Very nice videos you are making. Since I am now also in the Sony mod business, I want to start recording my DX. I think Bandicam is the program to go for. A video like from todays opening, what is the size of it? Must be a good couple of MB I would expect.

Thank you Janpeter.

So my first UNID was Kiss FM from Norwich? :O) The band was open to Croatia at the time. Now I think about it, that's not the first time Kiss FM has caught me out. Interestingly, C383 doesn't appear in the FM List search on the landing page.

Thanks also for the info on Radio K4 from Serbia.

Regarding video recording, I bought the full version of Bandicam a couple of weeks ago, which I consider to be well worth the £22. CamStudio, while free, was very temperamental with large files.

As for video file sizes, they can quite easily be in the order of a GB or two for an hour's recording. I am sure you must realise they will vary in size hugely, depending on the format, the audio and video quality, window size, etc. I have not mastered this and still tend to render the video to another file courtesy of AnyVideoRecorder. There will be optimal settings, but when the recoridng is over an hour long, I need to reduce the overall quality to shrink down the file size. Yesterday's recording was 37 MB while today's was 180MB. Both recordings were about the same length, but why the huge difference in file size I do not know, considering the processing was identical for both files. I clearly have a lot to learn. Sorry I cannot be more specific at the moment.

Cheers

John

From: BEAVAN SIMON
Topic: 32026 Message: 32026

Does anybody know of a station using PI code 5061 on 87.6mhz. I can't find it on FM list. It popped up on 87.6mhz yesterday at 11:22 (Rock music being played) when I was getting Italian and Balkan stations coming in. Could be spurious, but both Elad and SDR-Console software came up with the same code.

thanks

Simon

Hi William,

I found that Easy Network has been using this PI on 105.4 MHz. Easy Network has several transmitters on 87.6 MHz. So probably it was this one.

From: John Faulkner, Skegness
Topic: 32031 Message: 32031

https://app.box.com/s/5jjjhaaizdb2pnxjkhhk

I don't hear many Dutch pirates these days. Maybe there has been a clamp down?? The silence was broken this morning with Club Bam Bam on 97.0, received at near noise free levels at times via aircraft scatter. I imagine they are using a fair bit of power to get out here this well.

How is this station being received in the Netherlands and western Germany?

John

32032. Re: [SkywavesDX] ES to Albania - and help with UNIDs required

Yahoo group: SkywavesDX (2014)
Date: 2014-05-29 11:31:16 UTC
From: davebunyan@...
Topic: 32011 Message: 32032

Hi Andy,

My typo (letters have worn off keyboard and R is next to T) - I checked the RDSLog - one of the lines showed - "5000; [RDSRVR--]; 0 %: - ; Edication / Rock (5); RT A/0 = RDSRVR Release TRDS-000211 29/05/2007 - RVR Elettronica Spa____" - which is why I think the RDS encoder hasn't been set up from factory default.

(I capture RT/A as well as PTY as it can give useful additional info to identify the program).

I'm still looking to identify two others - but having looked at the actual raw stream on RDS spy files I've got a bit more of a clue as I could fill

PI:CCCC PS: NARODNI - according to Google translate "narodni" means "national" in most slavic languages - but in Bosnian and Serbian can also mean "folk" (as in folk music) and it looks like the PS was rolling text as

PI:0000 PS: ALBANIA - so is Radio Albania News on more than one frequency (only on 94.9 in FMList)

Will I ever find out? And when will the next opening be?

Rgds

David

32033. Video of OIRT Opening: 28-05-14

Yahoo group: SkywavesDX (2014)
Date: 2014-05-29 13:20:50 UTC
From: John Faulkner, Skegness
Topic: 32033 Message: 32033

https://www.youtube.com/watch?v=HpXeGSckhCs

Just to share this from yesterday.

Also to say that I have been playing around with settings in Bandicam and AnyVideoConverter. It is a shame that the overall quality currently has to be reduced in order to keep file sizes to a minimum, but YouTube have almost destroyed this video. They have severely degraded the video quality this time. I used their video enhancement facility but it made no difference. Scratching my head a bit here.

The actual file size I uploaded was 21 MB (15 minutes) but the original looks SO much better. I know we can't somplain too much for a free and seemingly unlimited service, but the unpredictability of YouTube makes things very awkward.

Cheers

John

32035. AW: [SkywavesDX] PI code 5061

Yahoo group: SkywavesDX (2014)
Date: 2014-05-29 13:30:41 UTC
From: Günter Lorenz
Topic: 32026 Message: 32035

There are a total of 4 transmitters of Easy Network on 87.6, in a relatively (in terms of Es) close area.
5061 would be an incorrectly used pseudo-reg PI of 5361.

A possible way around the YouTube copyright claims issue would be to reduce the audio quality in your recordings. This will have the effect of distorting the audio waveform and therefore possibly making it less easily recognisable by their software.

I have conducted a simple test where I have deliberately recorded several pop songs over a six minute period and processed the audio to 22050 kHz sample rate and 32 kbps bitrate. Admittedly, the audio is not great, but you can still hear it clearly enough for weak signal identification purposes. The best thing is, YouTube didn't block it! https://www.youtube.com/watch?v=vJzM0HJU_nk (Well, they haven't so far :O)

John

32038. Nice catch today

Topic: 32038 Message: 32038

Hi, today on May 29th I catch in Osijek/East Croatia Jerusalem FM station RDS identification 88F B, B is for Beer Sheva from Israel International Radio and TV on 88,5 FM, sometimes in stereo.

Tuner was Kenwood KT-6050 with 11 Elements FM Yagi antena made by Iskra/Slovenia pointing to NW.

In the same time on the other tuner Hitachi FT-007 on 94,3 MHz I received between readings from Kur'an one commercial for Eldorado shopping center, and later found on Internet that the location for it is in Beirut, Lebanon. The signal was in stereo but not enough strong for RDS reading. So I suspect on radio station from Lebanon.

Greetings to you all.

OK, scrub that. YouTube have caught up and "blocked the video in some countries". It was worth a try.

Hi John,
At the moment I have Club BamBam 3 with blocks on my Sony with wire antenna because I have no vertical outdoor.
I think due to tropo lift they are so strong because normally I don't hear them.
Ruud

I don't hear many Dutch pirates these days. Maybe there has been a clamp down?? The silence was broken this morning with Club Bam Bam on 97.0, received at near noise free levels at times via aircraft scatter. I imagine they are using a fair bit of power to get out here this well.

How is this station being received in the Netherlands and western Germany?

John

32042. Skegness Log: 29-05-14

Band 2 Meteor Scatter:
87.6 1914 TUN RTT Radio Tataouine, Zarzis (med) OM phone caller with stuttering and distinctive vocal, as web. NOT Es 2342km **
87.6 1932 CZE Radio Impuls, Brno/Koj?l (JM) 2203. Unattended. Approximate time 1219km

Band 2 General Scatter:
97.0 1050 HOL Club Bam Bam, Nunspeet (GLD) Pirate. Dutch pops, as web 378km

** Personal Skegness 'First' via the respective mode

I was stunned to hear Radio Tataouine coming through by meteor scatter this evening. This is another new personal record, but I can't help but think that the existing sporadic E event between East Sussex and Italy might have had a hand in it, which the path would have intersected. Prior to the meteor burst I had brief and very weak Es on 87.6 and had got the web streams of Chaine 3, Radio Laghouat (ALG) and Radio Tataouine up and ready as I was trying to work out where 87.6 was coming from. It faded all too quickly. I was beamed south-east at the time and seconds later a sudden meteor burst appeared for a second or so in which a hesitant and stuttering Arabic male phone caller could be heard. I realised who it was straight away and re-checked the streams. There was no question, Radio Tataouine had the same male caller, exhibiting exactly the same mannerisms. I could scarcely believe my ears as the Zarzis transmitter is 2342 km from here! Naturally I wasn't recording at the time, but I am determined to grab a recording of this in the days ahead, in the same way I caught Club Bam Bam earlier with the web stream running alongside.

Good DX!

John,

It was very likely Es enhanced MS, or MS enhanced Es, can☐t decide which!!
Certainly a combination of the two.

Back in my 6m/2m dx-ing days, when we knew the MUF was getting close, we☐d hear a lot more pings than usual, as even the smaller pings would just be enough to raise the MUF momentarily often just before the band would open properly.

I would definitely say that it was MS + Es combination.

Jim.

I would have guessed so Jim. Thanks for this.

2342 km is an uncomfortably long distance to claim for MS. I wonder how the propagation works with this. Perhaps such large distances give plenty of scope for both modes to interact - i.e. over 1000Km for each mode. It wouldn't work for shorter distances. I guess I might be able to claim "double hop". ;O)

Good DX!

Hi John,

during the weekend I will send you my suggestions about some italian signals you haven't identified or logged during this opening (I've watched the entire video on Vimeo).

It's very stunning how much signals you can get in Skegness..... one year or another I have to come there for a Dxpedition ..... (and also to improve my very poor english :)).

Thank you Franco. This is very kind of you.

Skegness is a great place for FM DX, perhaps with the fewest/weakest UK signals as anywhere else here and one of the reasons I move here. I am an FM DX addict! :O) I have written about Skegness on my (still unfinished) website. http://www.g1vvp.co.uk/skegness.php

You have no need to worry about your "poor English"(?) - it is better than many people write here in England! (Something I am slightly embarrassed to admit) :O) You would be very welcome here Franco.

I look forward to receiving your comments about my Italian reception.

Good DX!

John

32056. Tropo logs 30.05.2014

Yahoo group: SkywavesDX (2014)
Date: 2014-05-30 22:07:13 UTC
From: Arvid Husdal
Topic: 32056 Message: 32056

Hello,

A surprisingly good tropo tonight, with many new ones in the log.
The logs who I am pretty sure are new to me are marked With the "+".
By the way, tropo is still on ;), will have a listen tomorrow morning.

UTC Freq station etc-

1549 87.6 R 10, Smilde very strong signal
1549 87.7 +R 10, Lelystad
1557 97.9 +R Continu editie Noord, Tjerkgaast local ads from Twente
1559 97.3 +RadioNL editie Friesland, Heerenveen local with Leeuwarden ad or promo ?
1618 91.3 Simone FM, Hoogezand
1620 92.4 R Continu, Hoogezand
1625 94.5 +UNID pirate, omgeving Friesl./Groningen. Anyone know any active ones fitting ?
1635 95.3 Regio FM, Bedum
1657 89.9 +Radio NL editie Drenthe, Emmen w. Emmen-ads
1828 96.9 +R NORA, Heide
1853 105.2 +Offener Kanal Westküste, Heide ID as "Westküste"
1900 99.3 +Ems-Vechte Welle, Molbergen w. nx, after having metal show, good signal !
1901 104.5 +Radio 21, Leer wx
1924 92.4 +NDR 1 Radio Niedersachsen, Osnabrück
1929 95.0 +NDR Info, Bremen-Walle
1935 106.9 DLR Kultur, Aurich-Haxtum fooled me a bit With WDR3-Konzert
1941 102.9 +DLR Kultur, Lingen same comment as above, "WDR3" -ID
1959 96.0 +NDR 1 R Niedersachsen, Bremerhaven-Schiffdorf
20.00 104.0 + R Hamburg, Heinrich-Hertz-Turm maybe the best one today, totally surprising to catch this one! However, I don`t think I caught the local "Cityfenster".

73!

32063. FM-DX Loggings for 30 May 2014

Yahoo group: SkywavesDX (2014)
Date: 2014-05-31 08:16:24 UTC
From: Janpeter van Dijk
Topic: 168 Message: 32063

Hi All
A mixed DX bag yesterday, and a full one also. Not so much for the sporadic E though, which struggled to produce painstaking weak signals on OIRT only. But when I did a final check for the day, before going to bed, I found Band II full of tropospheric DX. And this was the first time I could put the modified Sony to the test. And it passed the test magnificently! Never before did I have so many stations with RDS, the RDS sensitivity is going to make a world of difference with Es openings.
Also I had a series of first time catches, like I am just starting with this hobby!
Below my loggings, which include the ones of the very early morning of today.

Best regards,
Janpeter van Dijk, Zoetermeer, The Netherlands.

** Personal Skegness 'First'

A weak tropo into northern Germany with only Steinkimmen at RDS levels.
No tropo in the direction of Denmark or Norway apart from the usual
scatter to Rangstrup and Bjerkreim.

I briefly observed a spell of tropo around late afternoon where parts of
Holland were enhanced to 41dB - the strongest tropo experienced so far
at the new QTH! Pity I wasn't able to listen at the time.

Good DX!

Hi John,
after listening carefully to your recording, here's my suggestions about some stations you haven't identified.
It's very interesting how the opening was selective about the area of Italy you was receiving: first Friuli Venezia Giulia (with Slovenia), then the area between Marche and Romagna, then Eastern Tuscany, Lazio, Southern Tuscany, then Liguria and Piemonte and, at the end, Sardinia.
88.3 1038 ITA Rai Radio 1 Friuli Venezia Giulia – Tarvisio Monte Santo di Lussari – Ud- (most likely). Excerpt from regional news bulletin (tnx to Alessandro Groppazzi for the confirmation).

88.4 1044 ITA Radio Deejay – Trieste/Conconello –Ts- Phone in (Federico Russo's voice)
89.4 1045 ITA Radio Deejay – Muggia/Strada per Chiampore –Ts- PI5214 (very close to Alessandro's house!)
94.0 1046 HRV Radio BnM – Barotul/Kapelica –Zd- Id "…..Zadar…na Radio BnM"
89.3 1048 ITA (presumed) Radio Deejay – Valdobbiadene/Monte Barbaria –Tv Phone in (too short to be identified for sure)
96.3 1050 ITA (presumed) Radio Maria – Pesaro/Novilara –Pu- (most likely) Pope's voice
93.4 1051 ITA Rai Radio 2 - Bertinoro/Monte Maggio –Fc- (most likely) Onda verde (traffic news)
93.0 1052 ITA (presumed) Radio Lattemiele – Ancona/Forte Montagnolo – An- (most likely) PI5355 But the song you've heard doesn't match exactly with Lattemiele format
95.5 1054 ITA Radio Studio + - Carpegna/Monte Carpegna – Pu- PI521A
95.3 1055 ITA R101 – Pianoro/Monte Calvo – Bo- (most likely)PI 5215
94.3 1056 ITA Radio Subasio – Cagli/Monte Petrano –Pu- (most likely) Id during song announcement "…su Subasio, Tiromancino"
91.4 1057 ITA RMC Castel San Pietro Terme/Monte Grande –Bo- I recognised announcer's voice
Right after Radio Gamma fade out: 91.1 1058 ITA Rai Radio 2 – Sesto Fiorentino/Monte Morello –Fi- (most likely) I recognized announcer's voice
106.9 1101 ITA Radio Mambo – Rocca di Papa/Monte Cavo –Rm- Latin music
101.3 1106 ITA (presumed) Centro Suono – Rocca di Papa/Monte Cavo –Rm- No id, but local news from Roma area
99.7 1107 ITA Radio Deejay – Buti/Monte Serra –Pi- (likely) Comedy show with impersonators
89.6 1108 ITA Radio Maria – Sesto Fiorentino/Monte Morello – Fi- (likely) Wednesday's papal hearing
93.6 1110 (presumed) ITA Rai Radio 1 – Marciana/Monte Perone – Li- News and interview
103.3 1114 ITA Isoradio (it could be from everywhere in Italy, but my 2 cents go to Monte Argentario/Monte Argentario vetta Gr)
103.9 1114 ITA Radio 24 – Monte Argentario/Monte Argentario vetta or Capannori-Monte Serra? News (I know the annoucer voice)
104.6 1114 ITA Radio 24 Asti/Azzano –At- in // with 103.9
105.0 1115 ITA Radio 24 Moncalieri/Colle della Maddalena –To- in // with 103.9
105.5 1115 ITA RMC – Caprino Bergamasco/Valcava –Bg- (most likely) PI 5215
107.7 1116 ITA Radio Maria – (between a lot of possible plants, i bet on Varazze/Monte Beigua –Sv-)

88.1 1117 ITA Radio Maria – Diano Marina/Capo Berta-Im-(likely)
87.9 1124 ITA Radio Maria – Cervo/Capo Cervo –Im- (likely)
Four suggestions more:
At 1127, you've logged on 93.0 Nostalgie France with French music, but it's Italian music. Unfortunately, I have no idea about the radio you listened.
At 1101 you logged Radio Maria on 107.2. Accordingly with the area of the other stations you've been receiving around that time, I think the most likely direction of the signal is Abbadia San Salvatore/Monte Amiata -Si-
For the same reason, I think that at 1107 (on 87.5) you was receiving RDS from Sarteano/Monte Cetona -Si- and, at 1107, you received Radio Maria on 108.0 from Marciana Marittima/Monte Capanne –Li-
Hoping to hear more recordings from you after next openings,
Franco
Radda in Chianti - Tuscany

Wow! Thank you very much for the log and information Franco.

Also thank you for the corrections. I need to make a few changes. This all raises some interesting and valid points:

There are often many transmitters carrying the same stations on the same frequency, so it can be difficult to be 100% certain of the exact site. I have mentioned this before - this is why I log, log and log as many stations as I can as it builds up a clearer picture of the location of the opening on the FM List map. The more stations logged, the clearer the picture and the more likely I will log the correct site. It's not perfect though. I have seen some wild claims of transmitter sites in the past. I look at my own loggings after the opening and try to assess the picture more accurately, making changes as necessary, but I am sure some sites have to be wrong. I really need to add a 'disclaimer' about this on my all-time log page.

I will also add the loggings you sent - there are so many. Thank you again. You will be credited for these too as, technically, it was you who logged them.

I am glad people are enjoying watching my videos. I am not aware of other DXers who record an entire opening, but it would be fascinating to look at other DXer's videos of entire openings.

Best DX Franco

John

Thanks Dave :-)
I don't have a video camera currently, but this won't be my last trip east
so maybe i can beg steal or borrow one eventually..

from Warsaw, Brest is 200km, (equivalent :Congleton to Wenvoe but only 4kw!)
Kaliningrad is 253km, (equivalent Congleton to Wrotham but yet again only 4kw)
Grodno must be somewere between those 2 distances

Lviv is only 337km (Equivalent to Irish reception or North hessary tor at home)

so clear band but very low powers
the only basis i have for an educated guess is that the Fire Brigade on 70 mhz used to get out very well

32069. I should probably ignore this, but ....

..... but the events around it are quite interesting.

A short while ago I received a solitary signal on 67.7 MHz in which I thought I heard a Radio Rossii ID. I then started recording this. Video here:

http://youtu.be/Tx6Oz7Fcfg4

The propagation was about right for this at the time. Nick phoned me at this time to try to fine a web stream on his Squeezebox internet radio to confirm the reception, but to no avail. My own web stream comparisons revealed everything this was NOT, but not what it WAS. At least I was able to rule out Radio Mayak, Radio Maksimum and UR1 Persha Programme from their web streams .... unless they had local programming at this time.

I don't know what the distorted mess is on 68.51 MHz, but it was very brief.

I stopped recording in order to process this recording as I assumed the opening had finished. Then I spotted something on 72.83 MHz. Once again, we failed to find a matching web stream. Then I checked on the Es (n) section. After trying a process of elimination we scratched our heads and wondered about Kanal Voskreseniye from Yekaterinburg. Immediately I thought against this as that would be 3742 km. The signal was so weak and scratchy it wasn't worth bothering about, but we ruled out the obvious suspects. Now I have just seen that Kanal Voskreseniye was logged around that time by Aleksanr Vorona in Ukraine. Coincidence? There is no way I could possibly assume that this is what I heard (but it's nice to dream), and there was nothing concrete to go on anyway.

What I am more keen to find is a confirmation of Radio Rossii on 67.7 MHz. I will never know if I had Kanal Voskreseniye, but hopefully somebody can say yes or no to my Radio Rossii on 67.7 MHz.

Thanks

John

It was regional Ukainian prg in Ukr.

Likely UR1 Kiev

It's possible if you look at today's map
http://www.fmlist.org/fm_logmap.php?datum=2014-05-31&omid=0&band=ALL

Kanal Voskreseniye is very easy to identify on the record (by the way)

Victor

Thank you Victor for your speedy reply.

I have been led astray by a regional programme once again. I will go back to the drawing board regarding double hop. :O)

Best wishes.

John

At least you've had something today Tim. There's been nothing here yet and the total sum of yesterday's efforts was a brief unid signal on 87.6 in the early afternoon.

Surely it can't continue like this throughout June can it?

Good DX.

It’s been little (if any) better down south. I can count 2 decent openings to Spain/N Africa/Italy and a half-hearted one to the Balkans and that’s it.

Even 6m has been very quiet.

If you live 5-10 degrees further East, it’s been a decent season so far!

Jim.

Hi All,

Managed to catch some DX flurries yesterday. This is nice, but I would love to get some Band II Es.

Best regards,
Janpeter van Dijk, Zoetermeer, The Netherlands.

From: Andy Pritchard
Topic: 32075 Message: 32080

In the Midlands the month of May has been shockingly bad for Es which has had me logging just a 1/3 of what I did last year.

I can only hope that things are going to improve as both yesterday and today the general level of European Es activity is well up.

I note most of the FM DX thus far has been over Eastern Europe which if anything increases the chance of double hop from the UK...

It’s been little (if any) better down south. I can count 2 decent openings to Spain/N Africa/Italy and a half-hearted one to the Balkans and that’s it.

Even 6m has been very quiet.

If you live 5-10 degrees further East, it’s been a decent season so far!

From: sniffingmoose@...
Topic: 32081 Message: 32081

Hello

Before you all die of shock! I am holiday in Switzerland and managed to catch some Spe last Thursday 29th May around 12noon

I was sitting waiting for a train at Landquart Railway station, Eastern Switzerland, with very high mountains all around and listening on my Roberts Sports DAB/FM portable radio.

When tuning around Laikos FM - FM 87.6 came on the RDS. I heard others with Greek music but no RDS so I could not identify.

Later that day I went up a mountain via cable car to over 7500 feet and standing in the freezing snow I was hoping for exotic DX but the band was dead. Just some weak Italians. Logged Radio Maria, Erba on 89.1 and that was the only RDS able Satation that was not local. I think because there are huge mountains that are around 12,000 feet you have to go up the very top to do well in Switzerland.

The early start to this season, April 26th - the same date that last year's excellent season began on band 2, we might have assumed we were in for another good season, but it has not been the case. We might also have assumed that the Es season would pick up as we head towards June. Not the case in the UK at all! The Es are actually going downhill. BUT, there's so much uncertainty with Es and they could pick up any day. There's still plenty of time.

Good DX!

Hi Franco.

I am looking through the loggings now and beginning to make amendments and additions. I realised I forgot to mention something. You commented: "At 1127, you've logged on 93.0 Nostalgie France with French music, but it's Italian music. Unfortunately, I have no idea about the radio you listened." I was checking the web stream against the DX heard, but you wouldn't have been able to hear this at the time as I was using two different computers, the laptop to run the XDR and the desktop computer to make the loggings, because this is much faster than the laptop.

Hope that clarifies why I was logging somethings which might not have made sense.

Cheers

John

I was away from the radio both times the Band opened to the UK - but at least I was able to capture one definite Greek station on the scanning set up (ST-311 + RDSSpy) - on 90.60 PI Code 9060 - Asteras Radio. I also got ERA 1 pi code 1201 - but that could have been any one of seven frequencies!

I would really like to have a set up that scans and logs frequency along with RDS data. I will probably never find a Sony XDR - but if I had one with the GTK software I would be asking if the software could be further developed to do just that as I'm really impressed by the video clips posted by John Faulkner and others - but it must take quite a while to review them. Add scanning to it and it would be fantastic!

Tropo reception here has been good for the near-by Europeans - the french speaking Belgian transmitters coming through particularly well, but the Netherlands not quite so good.

Totally mental! propagation has swung from East (OIRT band) moved across to Italy and now Sardinia.

Plus I'm getting Virgin radio from Italy on 88.0 - don't know which TX - but closest is 846km and furthest 946 km - so short skip - so might we be able to get double hop today? Just changed to F202 - France also very close.

The housework is not getting done today!

Received this
http://i1064.photobucket.com/albums/u379/brumlad36/100_3821_zpsc3606255.jpg
in Lincoln, UK, about 30 minutes ago. It was on 88.0MHz

Yesterday, I had quite a few 6 metre amateur radio contacts, e.g. Sardinia,
Majorca and several in mainland Spain.

At long last, it looks like things are warming up on the bands.

Absolutely mental 0914UTC to 1200UTC when everything stopped! Then suddenly at 1205UTC. on 88.0 ZITOUNA 7211 very strong.

So far best catch is "Magic Malta" on 91.7 at 1158-59UTC - just as the station id was given in English - which is a new country for me.

The pattern of reception clearly shows the progation direction (from my QTH) to have swung round from a generally easterly direction (POL) through the Balkans, Italy and further round ending up in Tunisia.

And reception is still coming and going.

Hi All,
Very good video from 1+1 Ukraine on R1. Also on R2 Moldova on 59.239,555 Mhz co-channelling with 1+1 Ukraine on 59.256,508 Mhz alternating, Moldova dominating now.

Finally Band gets going again this year.

I never thought I would say this but I received Radolina 88.0 from Italy and why is this so special well I have not been able to null out Heart Wales formerly Real on 88.0 but since I have been using a Triax FM 5 I now can.

It's been a very good opening from the Balkans/Italy/Romania now this is what we want to see more of.

Andy

Thanks Jurgen, R1 still going here with Inter, 1+1 and Belarus all fighting for best video.

Also had weak video on 59.260,397 Mhz suspect another Inter Tx.

Now got carrier on 59.243,470 Mhz which I see from your list is Novy Kanal. Not had this before. Got weak video but this looks more like Moldova which is present on 59.239,555 Mhz

Keep checking R3 but nothing yet, not sure my antenna is so good up there.

Thanks for the suggestions so far. It is a shame the signal is so poor but I hope something conclusive can be extracted from this if possible.

Good DX.

Nick, Whitchurch, Hampshire.

32136. Another Arabic UNID 88.3 - Algeria?

Yahoo group: SkywavesDX (2014)
Date: 2014-06-02 21:23:10 UTC
From: nick gilly
Topic: 32136 Message: 32136

Here's another one from 22nd May - Arabic YL on 88.3 with very poor modulation (this was recorded from the audiophile Yamaha T-2!):

https://app.box.com/s/8e2zpmd4g897w2o5ot3p

Could this be Radio El Tarf in Algeria? It sounds even worse than Chaine 3 on 87.6!

Good DX.

Nick, Whitchurch, Hampshire.

Yamaha T-2, Denon TU-800L, Kenwood KT-1100SD (modified), Yamaha T-85, Sony XDR-F1HD tuners, Triax FM5 horizontal beaming east.

Blown away with this new documentary just shown here on ITV in the UK, hope it wins an award, totally awesome

Hope it gets shown in Euro / US / Aussie tv soon, look out for it folks, perhaps you'll see it during an Es opening even :)

32138. Clips and UNIDs 2nd June 2014

Yahoo group: SkywavesDX (2014)
Date: 2014-06-02 21:48:24 UTC
From: nick gilly
Topic: 32138 Message: 32138

Hi all. Here are some clips from tonight's opening, with some interesting signals heard from SE Europe:

https://app.box.com/s/cli3io7wnkprxzdguc7t - 87.7 unid language. It sounds like there may be an ID 7 seconds in but it's hard to make out

https://app.box.com/s/y9vtmq0h0y4g4ds7ws3p - 87.6 various signals fighting it out. There's a station with an ad break mentioning restaurants and businesses in Sofia so I'm guessing this one is Radio Zorana, Sofia

https://app.box.com/s/kw7zuv1l7hplvjvngwgp - 87.5 Fokus Radio, presumably from Belgrade

https://app.box.com/s/09iy5asm8ai5wts7dll2 - 88.3 unids, interrupted by an Italian near the end

https://app.box.com/s/59pnybvmj3p5lk7nqiyl - 90.8 unids, one of which is playing some lively folk music

https://app.box.com/s/zak9a4h362dxn726q3m2 - 87.6 unids (Greek music is Laikos FM)

https://app.box.com/s/h4bcg5pg40afkd6xzxnk - 88.4 unids, the main station playing some more interesting folk music, the other station with pop (Simply Red, Falco)

https://app.box.com/s/6yns4vwo93ebm1xgeitm - 88.0 folk music plus some talk at the end, was wondering if it was Montenegro

https://app.box.com/s/pl38qri7nd96p11hoj9f - 87.6 BNR Horizont and Laikos FM

Any help with the UNIDs much appreciated

Thanks and good DX.

Nick, Whitchurch, Hampshire.

** Personal Skegness 'First'

/_*Highlighted Loggings:*_/ Unids, unknown transmitters, etc.

Well. Today saw a proper, full-on mid-season styled Es opening.

The highlight was undoubtedly receiving Crimea at the bottom of band 2.

Videos of the first part of today's openiong can be found at:
https://vimeo.com/97120979 (Most of the OIRT opening) &
https://vimeo.com/96703804 (Band 2 with Crimea).

There are further videos from today but I just don't have time to
process and upload them.

Here's soemthing which occurred to me today, something I was *accused*
of recently (in a friendly way), I am fast becoming addicted to logging
as many stations as possible. Understanding the area where the
propagation is coming from is very important, as I have said several
times, so the more loggings the better, but I think about those people
among us who like to *listen* to a station, rather than go up and down
the band to see what else is coming through. There really is nothing
wrong with either style, but I think my contesting on the ham bands a
few years ago has encouraged me to enjoy adding as much as possible to
my personal logbook. I am not bothered about listening to the programme
content of a DX station. I just want to zoom up and down the band and
discover what other possibilities there are.

Good DX!

John Faulkner, Skegness, Lincolnshire (JO03dd) <3m ASL.
Blog: http://skegnessdx.blogspot.co.uk

Hi,
The first one is in Serbian. It mentions "radio", but it also means "worked" in Serbian.

"Listening" during an Es opening? Only when my hands are glued to the steering wheel (i.e. while driving).
Yes, times were different when we had to wait for an ID, on an analogue tuner (=unprecise frequency readout fooled by AFC), without RDS.
While there is nothing wrong in using state-of-the-art technology, everyone should enjoy the hobby as he likes. I do fully agree with your statement: There really is nothing wrong with either style.

73,
Günter

This is RFE/RL (Radio Liberty is "Radio Svoboda") from Edineț / SRTV, Moldavia.

> 88.6 1027 AUT 88.6 Der Musiksender, Wien 1/Kahlenberg (wie) AC47 *_88.6_* 1247km **

If you want to QSL this station, let me know. I know somebody working there.

Thank you for this G?nter. I suspected as much.

I don't do a lot of QSLing these days. Problem is I am getting behind
with other things because of all this DX! :O) I appreciate your help.
If only I had more hours in the day.

Thanks anyway.

John

"I am not bothered about listening to the programme content of a DX station. I just want to zoom up and down the band and discover what other possibilities there are".

Me neither - at least not during an opening. And what I want "what I really, really want" is a radio set up that automatically scans and logs the frequency and captured pi code!

Not having that I again kept the ST311 running in auto-scan between 87.7 and 93.1 (with gaps to miss the locals). In two hours of RDS logs I have been able to identify 30 unique transmitters in 15 countries - many of which I hadn't 'got' when tuning up and down the band manually on the other radios, with the essential info from FMList. But it is tedious - and I haven't even looked at the second opening that happened this evening. It will probably take a couple of days to go through them all.

DXing can get tedious when there is so much data to go through. It puts me off getting a band 2 SDR as I know I will potentially be creating a lot more work for myself. Already I am having to think "Stop!" after a day's DXing of this intensity and not bothering to go through video recordings. If I missed things the first time then so be it. That's the end of it.

I think the videos are great to look back on at a future date and I also find it fascinating to see other DXer's videos. If people enjoy watching them then that's great, but I secretly hope that, in the event me missing that exotic station from Lebanon or Saudi Arabia (as if!) then it would be nice to be informed about this. I live in hope.

Cheers

John

I notice every time how FM List slows down under the height of the Es openings, but it's MUCH better than last year. This isn't a complaint, just an observation. There was a period in the middle of this morning's opening when FM List suddenly became very fast, so I don't know if any extra lanes had been opened on the highway, but it slowed down a few minutes after. I don't remember the time. But the list has been totally workable throughout the season so far.

An EXCELLENT service and one I am very grateful for!

John

Same here Jurgen.

Le Mouv popped in from Lyon on 87.8, a distance of 883 km. This was at 0851.

Sadly, I only started listening to the opening at 0800. Italy was reaching an incredible 70dBf! The whole band, including Belmont, was buried, but RDS was reluctant to form until things quietened down.

It's great to be able to see the signal levels on the GTK software.

Good DX!

32169. UNID OIRT Clips - any ideas?

Yahoo group: SkywavesDX (2014)
Date: 2014-06-03 11:19:32 UTC
From: davebunyan@...
Topic: 32169 Message: 32169

The OIRT band was open all the way to 74MHz along and Band 2 to 106MHz. The following clips are the same programme - on two different frequencies. Men talking - and it doesn't sound Russian to me. According to FMList there are only two transmitters on 73.55 - Radio Russia and Radio Blagovestiye (web stream had music). On 75.73 only BR Radyo Stalitsa - which is normally 'pop' music.

The station on 73.55 is over-modulated/badly distorted - the one on 75.73 sounds much cleaner.

But what language/country/station??

Thanks

David

https://www.youtube.com/watch?v=Yjjg4QVbvqA

B2 E Skip, some help here would be appreciated...

https://www.youtube.com/watch?v=ZzjY3hmtcHQ

With reference Band 2, there were a few more I did not include because of YT copyright purposes. 89.0 had some new age jazz music in English, 91.0 had a dance track in English & a local language, 87.8 had Bob Marley playing (I think it was Italy, although not sure), & 88.7 had some old style local sounding band music but it was only for a few seconds & was clashing badly with BBC R2 Rowridge on 88.5.

sleeper77, Southampton.

I don't know exactly what you mean with this Günter. But I have noticed cosiderable variations in the speed of FMLIST. While this may be a busy day, it si not even close to what it could be with a massive opening during the weekend.
So, this raises concern. And the question how to solve this. What I was thinking of is the option that the data base could be entirely downloaded at the start of any log session. Or at least for the expected skip area. In order to limit the user - FMLIST interaction to the uploading of loggings only.

Just a thought of a digilliterate. You can tell me is this is a stupid idea :-)

From: Satnipper
Topic: 168 Message: 32180

A modest annual subscription to use the site (login) would be in order I feel - around £20/€25. This would be analogous to paying $30 to access automated XML data with QRZ.com.

Regards

Stuart

From: orionz25@...
Topic: 32170 Message: 32181

Thank you. Just a regular Omni antenna, I cannot have anything fancy since I live in a communal area. The signal booster I use seems to help though. There was a better opening later in the afternoon yesterday with Belarus & Ukraine being more enhanced. Maybe I might edit my recordings & upload later if I have the time.

sleeper77,

Southampton.

For the avoidance of doubt, I had no intention whatsoever to complain. I did use the word unworkable though, which was indeed the situation for me. Page loading took 20-30 seconds and for me that is not really workable. Being the same type of DX-er as you are John, trying to get as much as I can.
Still FMLIST is a fantastic tool, I couldn't do without anymore. But I hope the speed issue can be solved.

I notice every time how FM List slows down under the height of the Es openings, but it's MUCH better than last year. This isn't a complaint, just an observation. There was a period in the middle of this morning's opening when FM List suddenly became very fast, so I don't know if any extra lanes had been opened on the highway, but it slowed down a few minutes after. I don't remember the time. But the list has been totally workable throughout the season so far.

An EXCELLENT service and one I am very grateful for!

John

The location for these two stations:
73.55 MHz Horodok/KHFKRRT-vul. Radyans'ka 1-A (km)
73.73 MHz Kul'chiyivtsi/KHFKRRT-vul. Tsentral'na 52/1 (km)

Both shall be added to FMLIST. As well as others like:
71.78 MHz UR 2 - Radio Promin', Olevs'k/ZHFKRRT-vul. Svyatomykolayivs'ka 146 (zh)
72.02 MHz Radio Karpati, Ivano-Frankivs'k/IVFKRRT-vul. Chornovola 19 (this is your UNID from yesterday John)

From: Günter Lorenz
Topic: 168 Message: 32184

Hi Janpeter,

Not a bad idea at all ... Jurgen's StationList is such an "offline" client. A new version of RDSDX could be such a tool - but I guess we won't get one from the original author ... I do support such projects, unfortunately, my own time does not allow developping them myself. I think there is a lot of potential in the XDR server software.

Traffic on the server comes from various sources, and it is a bit like road traffic: At certain times, everyone wants to "drive", and that causes congestion, even on multi-lane motorways. In the past, there has been pretty much traffic by search engine bots. They don't care about server load. Since last autumn, I am analyzing them and blocking access to the server for all the bad bots, allowing only a few important ones. After the speed problemthis morning, I have implemented a switch to tell the "good" bots to return later, while we are busy logging. This, together with another modification that I made, will certainly help to keep server load low.

Another source of possible interruption is FMSCAN traffic. As this is an anonymous site, we cannot prevent FM DXers and others using FMSCAN to make all kind of things while an opening is going on. If someone generates PDF files in FMLIST or userlist files with FMSCAN, that is like a big slow truck on a two-lane motorway. It will go away after a minute or two, but it takes a bit longer until the pile-up calms down.

I am having a very close look at the speed issue, and learning from each and every event. So, let the logs roll in !

Günter

Hi,

90.8 is in Serbian language, in the add it mentions ˝Betonstil˝, a factory from Serbia, later it talks about emergency phones for Serbia

88.0 should be Montenegro, man mentions Cetinje, former Montenegrin capitol

Unfortunately, there is no ID for either of the two stations, at least I didn´t heard it

Hi sleeper77. For some reason the audio is cutting in & out in quick bursts followed by longer silent gaps.

Hopefully an easy fix.

Good DX.

Nick, Whitchurch, Hampshire.

Thanks Nick. I can hear it ok on my side, so I think maybe it is the audio is too high. I would try Youtube but I fear it would be blocked once any music is heard. I will lower the audio now.

sleeper77, Southampton.

Hi all,
This morning's opening started suddenly, almost as if someone flipped a switch, and lasted longer than I could follow...

There were cases of >30 dBf total mess at some frequencies, no id, no audio, just messy noise...

From: Privat Patrice
Topic: 32205 Message: 32205

Hi

Short distance indeed !

Normally I never have Austria by E's from here (Beauvais, square JN19).

i was intrigued by a German language programme of classicalmusic on

87.6 this morning, which brought an end to a long spell of Polish E's

(_JEDYNKA_) on RDS;

it turned out it was ORF1 in Bruck, first time i get such a close range hit.

PAT

32206. FM-DX Loggings for 3 June 2014

From: Janpeter van Dijk
Topic: 168 Message: 32206

Hi All,

An interesting ionospheric propagation day today. Which started shortly after local midnight, with a very unstable opening into Istanbul. Next was an early morning short skip opening into Central Europe. Things were weak and short lived, therefore not a lot could be identified. But I am sure there were a few stations from Austria and Germany. I did manage to catch one station from the Czech Republic, which is the first time in many years.
It did not take long before the expected happened, an invasion from Italy. This season's first big fat opening to the top of the band. Again some unusual short skip was noted, from hardly ever received areas in Italy. After a RUS / UKR intermezzo, the day was topped off with a nice but short opening into Scandinavia.
More like this please.

Best regards,
Janpeter van Dijk, Zoetermeer, The Netherlands.

Yes David, it is an endless task. Fortunately the FMLIST team is big and working hard to keep things up to date. But sometimes things are running behind somewhat for some countries.

** Personal Skegness 'First'

I came into today's opening rather late but still heard some intresting
new DX from Poland, the Czech Republic and Slovakia. Italy preceded
this, but when I first tuned in, shortly after 0800, hardly anything
from Italy was RDSing, despite some very strong signals. I can now use
the term "very strong", knowing it has a bit more weight behind it. The
XDR, barefoot, gave no idea how strong signals were. Same with the
KT6040 to a degree, but now I have a reference figure and so i could see
that some Italian signals were actually stronger than Belmont - even if
I were to beam directly at Belmont itself! Needless to say, ALL Belmont
transmitters were wiped out.

Good DX!

Hi Chris,

finally it works!

93,50 you've Spanish Onda Cero, ID at 01m22s, there are 3 sts on FMlist, no idea which one you received as there is no local ID
89,10 UNID, they are talking about a movie starring Al Pacino
87,50 Subasio of course, with local advs for Ancona and Porto San Giorgio, so Fermo/Capodarco tx
87,60 UNID, just political talk
88,30 Sportiva; if heard at the same time of Subasio you probably received the tx from Rocca di Papa RM
90,30 at least 2 stations, at the beginning one with Nxs another with music (Ligabue), then both with news. No ID hrd and I don't know the speakers' voices, maybe some other Italian DXer can halp you about these stations.

Alessandro

Hi Chris, hi Alessandro.

On 90.3 I can hear two different news bulletins.

The first one is aired by Radio Deejay (very likely from Rocca di Papa/ Monte Cavo -RM-) . The second one (starting close to the end of the recording) comes from RDS, likely from Cesena/Monte Cavallo -Fc-

Franco
Radda in Chianti - Tuscany

Hi,

concerning 87.6 it's likely Rai Radio 1 from Rocca di Papa/ Monte Cavo -Rm-, but without knowing the hour of reception, it's really difficult to hazard a plausible guess.

I agree with the orher Alessandro's suggestions.

Good Dxs and many 73's from Franco

32221. RDS on OIRT - Myth or reality ?

Yahoo group: SkywavesDX (2014)
Date: 2014-06-04 10:40:11 UTC
From: Dave
Topic: 32221 Message: 32221

I presume it is a myth but I read somewhere once on digital spy there were a few stations with RDS on this band but I can't see there would be really, anyone know about this ?

Hi all,
can anyone help with this short recording - (maybe Stipe or Rudolph from Croatia) - heard yesterday on 101.6, short news jingle and then start of news. The recording is very short. I'm wondering is this from Bosnia?
Any help would be great. Here is the recording:
https://app.box.com/s/cd8xmfdde2n2058s3t15 thanks!

Ex-YU 101.6 help needed

Hi all,can anyone help with this short recording - (maybe Stipe or Rudolph from Croatia) -
heard yesterday on 101.6, short news jingle and then start of news. The recording is very
short. I'm wondering is this from Bosnia?Any help would be great. Here is the
recording:https://app.box.com/s/cd8xmfdde2n2058s3t15 thanks!Paul Logan,Lisnaskea, N.

Yes, there's several in Russia. Go through the loggings of DX-ers a bit further to the east, they are regularly listing what RDS codes they receive. These Russian stations are a bit too far for us to receive with single hop Es.

Onderwerp: [SkywavesDX] RDS on OIRT - Myth or reality ?

I presume it is a myth but I read somewhere once on digital spy there were a few stations with RDS on this band but I can't see there would be really, anyone know about this ?

Hi Chris,

from 9:05 to 10:00 (CET), Monday to friday, Rai Radio 1 broadcasts daily (since 1980 !!) "Radio anch'io" with debates and interviews about politics, economics and community life and in fact, in the piece you shared, you can hear an opinion about taxes.

So it's very probable you've heard this channel because on this frequency there is only one Radio Radicale tx (and it doesn't seem the kind of broadcasts they do in the morning) and there is no transmitter of Radio 24 or Rai GR Parlamento.

But please take it as a mere "tentative identification".

I think that is what I had, but these 20 second long openings just failing to reach RDS levels makes it difficult to ID stations !!

There's been a lot of that this season - 20 seconds here, 20 seconds there, with several minutes in between with nothing. The Scandinavian opening yesterday was very similar.

Jim.

From an interesting article in this month's BDXC Communication magazine. The original source is at <http://elpais.com/m/elpais/2014/05/01/inenglish/1398940943_100116.html> http://elpais.com/m/elpais/2014/05/01/inenglish/1398940943_100116.html

All the foreign language stations on the Costa Blanca, including the well know Bay FM. would appear to be unlicensed.

Stuart

Philip,

You need to go to FMList.org and sign up.

Once you have, you can go to MyFM and enter the frequency and pi code in the appropriate places, and FMList will come up with any matches it has.

You can also place your loggings on there.

I just put 87.6 and 7fbb through it and there is no match. Where was the band open to at the time??

Jim.

I see on DXPETR's youtube channel even the Italian private band use RDS,
this is weird, are there RDS tuners which cover this band ?

The opening burbled on for around 3 hours here, mostly Sicily/Malta and perhaps Tunisia for first half, moving over to mostly Algeria for the remainder.

Problem was that many of the Algeria streams, e.g Laghouat, Soummam, Batna and so on, were down which made ID'ing of most stations rather difficult.

All gone now, with MUF's dropping. Lets see if we get an afternoon peak.

Jim.

Same here Jim. Steady but sure, although slightly more in the way of Spanish DX here. Most of it was too weak for RDS.

I never look forward to openings from Algeria as stations can be difficult to track down without the web streams, but a few local IDs were heard today, including Radio Laghouat, Radio Tiaret and Radio Mascara, so a fairly productive opening on the whole. Laghouat was pronounced "Min Ah-hwat".

Hoping for more soon!

Good DX

32270. Question about TV-DX

Yahoo group: SkywavesDX (2014)
Date: 2014-06-05 13:15:01 UTC
From: Christian Stödberg
Topic: 32270 Message: 32270

HI! I’m going to try TV-DX on a more ”higher" level. I have access to a 5 el Yagi for 50MHz, preamp and a separate receiver that can handle all analogue formats PAL, SECAM and NTSC with their divisions on audio and video carrier. I have a TV-set that can handle PAL and SECAM, both B/G and D/K and a monitor that is equal to my receiver. The RX can be connected to the TV-set and VCR through SCART and monitor through RGB. But how can I record a SECAM D signal on a VCR, that can handle PAL/SECAM B/G through the antenna tuner I think, through SCART from the RX?

73’s de Chris

A word of warning about using the XDR-F1HD in band 1. My own modified XDR-F1HD is not good in band 1. While I have adapted it to tune down to 50 MHz, audio becomes intermittent once I tune below 63.2 MHz. The audio will chop out if not tuned to a XX.00 or XX.05 frequency. So 55.25 MHz will work while 55.24 or 55.26 will not. That's OK for Italian STLs as they use .00 and .05, but just an observation from this end. Does anybody else have this issue? I guess the XDR-F1HD is just being pushed beyond its capabilities.

John

After checking the locators for each site, Yershov would seem to be the most likely tx. and fits in with the conditions reasonably well. Anybody else getting this?

Oh, and Kherson was coming in at the same time - received also at 1639 this afternoon on 71.90.

Apparently this is a function of the chip used. Below 63 MHz it mutes if it's not a round 100 or 50kHz step.

Mine works ok on OIRT but strong BBC images from the big boy carriers present – really needs bandpass filter to be switched in.

Yes, it seemed to be something of that nature due to the precise
frequencies on which it muted itself.

I only get one very weak BBC Radio 4 image if I beam directly at
Belmont. It's on 67.4. No problem in other directions where the band is
very quiet indeed.

I can report that Kherson and Tver were the only two OIRT signals coming through at the time. I was scanning up and down the band to see if anything else was coming through in the hope of confirming the transmitter, but I did not hear anything else.

Good DX!

What attitude JF? Is it that time of year already when you pick a fight
with someone?

You pay $35 the" trial trial" goes away. I'm answering the OM's question on
how to make "trial trial" go away.

Hi John

I'm using Vac V4 which I purchased in November 2010 which runs ok. If you are running V3.0 there is a small upgrade charge for V4.

Drop the author an email if you paid for V4 and you get the "trial trial"

32309. Re: [SkywavesDX] Another Arabic UNID 88.3 - Algeria?

Yahoo group: SkywavesDX (2014)
Date: 2014-06-05 22:13:17 UTC
From: nick gilly
Topic: 32136 Message: 32309

Well I posted about this on Real DX and so far Tarek has confirmed that the Arabic in the clip is not Algerian. Ruud has suggested that it may be Radio Msallata from Libya which would definitely fit with the conditions at the time. A short while before I had Radju Malta on 93.7.

Don't some Libyans have over-modulated audio like this? I seem to remember reading something along those lines in the past.

Good DX.

Nick, Whitchurch, Hampshire.

Yamaha T-2, Denon TU-800L, Kenwood KT-1100SD (modified), Yamaha T-85, Sony XDR-F1HD tuners, Triax FM5 horizontal beaming east.

Here's another one from 22nd May - Arabic YL on 88.3 with very poor modulation (this was recorded from the audiophile Yamaha T-2!):

https://app.box.com/s/8e2zpmd4g897w2o5ot3p

Could this be Radio El Tarf in Algeria? It sounds even worse than Chaine 3 on 87.6!

Good DX.

Nick, Whitchurch, Hampshire.

Yamaha T-2, Denon TU-800L, Kenwood KT-1100SD (modified), Yamaha T-85, Sony XDR-F1HD tuners, Triax FM5 horizontal beaming east.

32311. Re: [SkywavesDX] Radio Rossii 68.48

Yahoo group: SkywavesDX (2014)
Date: 2014-06-06 00:56:57 UTC
From: John Faulkner, Skegness
Topic: 32282 Message: 32311

No.

To reiterate from my earlier post .... /"I can report that Kherson and Tver (*if* it was Tver) were the only two OIRT signals coming through at the time. I was scanning up and down the band to see if anything else was coming through in the hope of confirming the transmitter, but I did not hear anything else." /

When I checked the prevailing Es paths the only transmitter which seemed 'on beam' was Yershov, but at 3210 km I was reluctant to claim it, especially as there were nearer transmitters. But there were no paths on the 6m band running out that far to the east, plus I checked the direction of Tver when you suggested this. While there were no corresponding Es paths out that way, there could have been a path crossing the point of another opening, so I can only estimate "possible but unlikely". In other words, I do not feel comfortable in suggesting any of these sites, but the stream was 100% in // with the Rossii web stream. I also checked against other station's streams in order to rule them out.

This will be another one that got away, sadly.

John

Thanks, Janpeter!

It seems my copy of FMLIST for Turkey was not fully updated...

I also kindly got these updates from Kurt (in Istanbul):

Hi Peter,

I checked your listings:

87.5 TUR Istanbul/Camlica mam-itsrt Delta FM s 29e04/41n01 220 DELTA_FM 3439, 16.53 UTC
Is now Damla FM, since 6.4.2014 (language is not Turkish, but Kurdish!!)

88.2 TUR unid, PI: 3481, no listing!!!
Is Adapazari, existing in FMLIST since 23.11.2012

89.4 TUR unid, mono, no PI, no PS, 45 dBf, 17.16 UTC
No idea what this could be. (Radyo Mastika from Istanbul is with RDS and in stereo.)

88.2 TUR unid, PI: 3222, no listing!!!
PI 3222 is Slowtürk, but no location known

89.7 TUR Tasova/Karacam Tepe kdz-ama tr (spoken id:) TRT FM 36e19/40n45 365, PI: 3468 (not listed!), 17.40 UTC
PI 3468 is Küpe FM, sounds like Silivri, last received with PI 4028

97.7 TUR Unid, PI: 3405 no listing!!!, Radyo Müzik???, 18.05 UTC
RS FM from Kirklareli (listed without RDS)

73 from Istanbul
Kurt

32315. FM-DX-pedition in SW Finland - 5.6 - 16.6.2014

Yahoo group: SkywavesDX (2014)
Date: 2014-06-06 08:06:32 UTC
From: harriku@...
Topic: 32315 Message: 32315

Hi all,
Once again 8 FM-DXers group joined for DXing in distant Utö-island in SW Finland. This is 7th time in a row.
The Utö15-pedition started yesterday evening 5.6.2014.
We had the first opening already right after installations (South Balkan etc.)

We have even 24 Sony XDR-receivers at present (some GTK-modified), 6 x Perseus FM+ and 2 x SDR-sticks.

You can follow the pedition in Utö-FM-DX-blog with daily condition-updates:

My location is in Northwest England between Wigan and St Helens.

The Balkan opening lasted about 10 mins before fading out.

Andy

32326. Es - Italy mid-evening

Yahoo group: SkywavesDX (2014)
Date: 2014-06-06 21:43:27 UTC
From: davebunyan@...
Topic: 32326 Message: 32326

Just out of interest there was a brief opening to Italy between 19:38 and 19:52. These were the two times that RDSSpy log recorded PI:5201 PS: RAI 1 - recording the scanned frequency range from the Sony ST-311 The frequency was somewhere between 87.7 and 93.1 MHz

Rgds

David

** Personal Skegness 'First'

A video of this opening can be found at: https://vimeo.com/97529442 The
opeing had many Arabic stations which I couldn't identify. I was unsure
if I had Libya on 97.5, though it is more likely to have been Algeria.
Same for a mystery Arabic station on 88.3 which seemed to be in // with
Tunisian stations, however, Radio El Tarf appeared on 88.3 a short time
afterwards so it could have been that. Some of the web streams could not
be accessed to confirm the mystery stations.

Accented English was heard on 88.5, briefly, around 1600. It was
definitely Es as the band was trying to open around 88 MHz and below,

but I never found out what it was.

Good DX!

It lasted all but 10 mins and they come give a PI and then go again I keep hearing weak signals so it's worth keeping an eye on it.

Interesting opening today around the foot of Italy and into Greece. First time I had Greece strong enough to RDS here.

One UNID, don't know if anyone has the answer to this one:

97.7 PI: 4D7F, PS: KRASH

Can't see anything on FM List for this.

Jim.

The Story Behind Britain's Vast Radio Blitz
Fri Jun 6, 2014 9:14 pm (PDT) . Posted by:
"George Grempczynski" pulpshmoo
(from
"The War Illustrated", September 15, 1944)

The
Story Behind Britain's Vast Radio Blitz

Every hour of the 24 the air over Europe is charged
with the War-Voice of Britain sent out by the B. B. C. In frantic endeavour to
quell the unceasing Voice from London the Nazis are devoting more time, money,
personnel and material than they are expending on their own broadcasting, as
explained here by Capt. Martin Thornhill, M. C.

ITis doubtful if the threat of death ever deterred Europeans under the Nazi heel
from listening-in to London. At any rate, Goebbels has frankly admitted the
failure of the extreme penalty by setting up a Broadcasting Defence Department
with dictatorial powers and summary orders to smash Britain's big radio blitz.
Staffed by the best experts Germany can produce, this Department at once
decided on a policy of jamming ,on a scale never before considered practicable.
On the orders of Berlin's "Jam Chief",
regional controllers now charge the ether over Europe with a barrage of
miscellaneous din which would make the uproar of the world's biggest menagerie
sound like a monastery by comparison. First, programmes to be attacked are
selected, then instructions are sent to hundreds of widespread jamming
stations, most of which function in local Gestapo headquarters.
When the programmes start, a medley of Morse, gongs,
bird screeches, loud crosstalk, musical discords, machine saws, hammers on
anvils, and factory whistles fills the air. If the noise seems ineffective, the
listening controllers call up still more jammers in the frantic endeavour to
quell the unceasing voice from London.
The voice? There arc scores, hundreds of voices. Vet
not long ago, in face of increasing Nazi victories, the best our aerial
propagandists could do was to tight a stiff rearguard action. Inevitably the
worsening military situation had a tragic effect on the propaganda position.
There seemed little to say that would help the cause of freedom, and far too
many hours a day in which to say
it. We were losing everything; more important, from the publicity point of
view, we were being progressively deprived of the only bases from which it
might be possible to meet the enemy "on the air" on anything like
equal terms.
For only on the air would it be practicable to exert

any pressure on Germany or German-Europe at all. But the difficulty was, how to do it. with the Nazis in control of almostevery radio station on the Contient. Full well did the Nazis realize the value of quick seizure of local wireless centres. The first "soldiers" to ride into a city were radio engineers; in a matter of hours, sometimes minutes, the transmitters were mouthing mealy quisling welcomes to the "saviours who had come to deliver the people from oppression".

By the middle of 1942 the Nazis were boasting that their powerful controlled European network was exerting more radio influence on world opinion than that of any other country. Yet the British stood firmly by the conviction that victory could be brought nearer bymonths, perhaps years, by supremacy on the air. And at the end of of that year our Controller of Overseas Services claimed that "Britain was nearing parity with the Axis Powers", that "the United Nations as a whole could now compete with the Axis in the short-wave field". Out of a beginning with four people, broadcasting for 10 hours a day on a programme allowance of £10 a week, the service had now grown to three separate programmes broadcasting 24 hours a day in 15 languages, and employing nearly 500 people.

Today, under the very nose of the Gestapo, many thousands of the slaves of Europe listen hourly to the heralds of coming liberation in the voices of kings and queens, prime ministers, diplomats and patriots. In 24 languages on 26 wave-lengths over 600 persons wage--non-stop--the B. B. C.'s radio war on Hitler's Europe. And Hitler, himself a keen believer in radio splutter, who planned to protect his subjects against propaganda with propaganda, is now confronted with the memory that it was Britain's skilful use of this weapon that ruined German morale in the last war.

The first really effective use in the present conflict of this, the primary weapon in our psychological armoury, was when the excellent radio station at Bari was put into reverse against the enemy in northern Italy and throughout the Balkan peninsula. Working over 16 hours a day, Radio Bari has been relaying daily six B.B.C. broadcasts in Italian, and five American programmes, and pumping into German-held territory a daily commentary on the war, along with detailed information of German troop dispositions and instructions for sabotage.

That our control of this first-class station seriously worries the enemy is patent from his repeated but ineffectual attempts to block the transmissions, much as he jams tho^e going out to the rest of Europe direct from the B. B. C. For the entire radio offensive is supported by intelligence work which enables us to keep strictly abreast of requirements. Trained radio scouts all over Europe counter everymoveof the Gestapo, and keep the B. B. C posted on day-to-day reception and listener-reaction.

It is known exactly what types of wireless sets are being used in respective areas. Easy instructions are broadcast as to how the range of the less powerful instruments can be increased so as to hear London more distinctly, and hints on how to reduce jamming. If the Germans augment their jammers, the B. B. C replies by transmitting the same programme on

several separate wave-lengths.
A vital factor in building up an audience was the
security of listeners. A favourite Nazi dodge was to introduce, without warning, a distinctive jamming note so that radio sleuths listening near houses can detect sets tuned in to London. Radio intelligence enables the B. B. C. to warn listeners when this expedient is imminent. In fact, this aspect of the radio offensive has reached such perfection that not only the inception of the underground movement by the V-campaign, but its rapid increase and expansion throughout Europe, has been due almost exclusively to sustained support from the B. B. C. Thousands who 'might never sec the underground news sheets learn their contents via London radio.
Of the immense influence wielded by the Voice of Britain
the B. B. C. have ready evidence, much of it from official action taken by the Nazis themselves. A certain U-boat commander returned home and reported that his and two other submarines had been attacked by British aircraft. The other U-boats, he declared, had declined to open tire, attempting to escape by submerging. But before they could do so the aircraft had swooped and sunk them both, making off when confronted bv the guns of the third. The lucky captain was congratulated on his escape. But his satisfaction was short-lived. When the version put out by the B. B. C. reached German official quarters the ungallant commander was promptly court-martialled. It was his ship, not the others, that had stopped firing and had plunged to safety.
It may seem odd that Germany should have accepted
London's word rather than that of one of her own nationals. But it is further proof of the faith that German as well as other listeners place in the news and propaganda coming to them from the B. B. C. If official German quarters will discredit their own news sources, preferring to rely on statements from London, how much more will the mass of the people incline to belief in British propaganda?
When the war was going well for Germany the truth
provided Nazi propagandists with first-class material. Now the boot is on the other foot.

John,

Thanks for this.

The PS didn't change from "KRASH" despite being in at excellent strength for several minutes.

Cheers

Jim.

32338. Greek UNIDs

Yahoo group: SkywavesDX (2014)
Date: 2014-06-07 20:11:02 UTC
From: John Faulkner, Skegness
Topic: 32338 Message: 32338

Today's Italian opening moved into NW Greece for a time. Kerkira was present on 91.1 and there were two stations on 89.8 and 93.8 which I assumed to be ERA3 and ERA2, respectively. When I checked them against the web streams they were not in // and I wondered if I had heard local opt-outs or something else. These were the streams I tried at the time:

ERA2: http://tunein.com/radio/ERA-Deytero-1037-s24865/
ERA3: http://tunein.com/radio/ERA-3-Trito-909-s24866/

After the opening had finished, Nick gave me two other stream addresses for the same stations, but they carried different programming:

http://hprt.flashcloud.mediacdn.com/hprt/proto/chunklist_w150675973.m3u8
http://hprt.flashcloud.mediacdn.com/hprt/radio/chunklist_w1040423039.m3u8

So my question is, Do ERA2 and ERA3 have local or regional programming?

I uploaded a video of the main part of today's opening. You can hear my UNIDs at:

89.8: 17:05:54 (11:37 into the recording)
93.8: 17:15:58 (20:42 into the recording)

There is also an unidentified Greek station on 92.8:

93.8: 17:16:55 (21:38 into the recording)

Thank you if anybody can help with these.

Good DX!

John

From: Privat Patrice
Topic: 32336 Message: 32340

Hi Jim

I also had a Greek station on 94.8 strong but without RDS;

they ran adverts for "flamingo hotels", maybe it was Erotikos.

At one point I think I heard Albanian on 94.9;

cheers

pat

Referring to your "Sout" ID Peter, could it have been Sout Al Khaleej from Qatar? I don't know how far that is from your location in Nepal.

Good DX.

Nick, Whitchurch, Hampshire.

Yamaha T-2, Denon TU-800L, Kenwood KT-1100SD (modified), Yamaha T-85, Sony XDR-F1HD tuners, Triax FM5 horizontal beaming east.

ERA/ERT dosn't exist anymore, new national Broadcaster in Greece is NERIT

They transmit 3 Programmes First Programme and Third Programme and a
Regional Programme

Frequency information can be found here (with english translation) incl.
netradio links:

http://translate.google.com/translate?depth=1&hl=da&ie=UTF8&prev=_t&rurl=translate.google.com&sl=el&tl=en&u=http://www.nerit.gr/radiofonia/sixnotites/ [http://translate.google.com/translate?depth=1&hl=da&ie=UTF8&prev=_t&rurl=translate.google.com&sl=el&tl=en&u=http://www.nerit.gr/radiofonia/sixnotites/]

But i'm pretty shure not all Frequencies are in use.

I've just been a week on Crete in the town of Chrania and there only 92.9
and 94.9 was in use 90.1, 104.0 and 106.0 was inactive. Regional
Programme was on 100.6 and the new Frequency 99.9 MHz.

But also several Private Broadcasters mentioned in FMlist was missing in
the Air.
87.6 to 89.5 and 101.5 to 105.0 MHz was totally empty for Local Stations.
But some Spurios Frequencies was heard on 88.2 and 88.8 MHz (Mixing 91.0
together with 93.2 and 93.8 MHz.)

73's

32352. Re: [SkywavesDX] Greek UNIDs

Yahoo group: SkywavesDX (2014)
Date: 2014-06-08 11:18:30 UTC
From: Chris Thatcher
Topic: 32338 Message: 32352

Well that's strange. How come I received RDS saying ERT_NET on 88.0MHz, via SP-E, just a few days ago?

Chris.

Thank you Niels.

Until I get the RDS or ID I will not add these to the log. I hadn't
realised ERT was no more.

Best DX.

John

Forgot to mention the languages. The French clip is very noisy. The Arabic clip is clearer.
Any accent? Audio clips from this morning at around 06:50 UTC
First clip (French) has been amplified as it was weak.

Yes, I think this is what is happening, but I don't know if the former emploies from ERT still have their own Programme at some of the former ERT Frequencies.

In Chania 92.9 and 94.9 was without RDS and only half of the received private Stations had RDS.

Thanks but only single hop Julian-bit like you receiving Estonia. Hmm OIRT capability? Familiar with Tecsun DSP radios like the PL-606 in the video? 64-108 MHz :)

I also have two RTL-SDR dongles with me.
There was no OIRT unfortunately-I've been hoping to get some. There was a TV carrier on R2 59.25MHz which might have been from the same location.

Peter

OK NP Peter.

The only service I can think of off the top of my head from the Middle East that would mix French & Arabic is Radio Monte Carlo Doualiya but there isn't a site listed on 87.9.

Good DX.

Nick, Whitchurch, Hampshire.

Yamaha T-2, Denon TU-800L, Kenwood KT-1100SD (modified), Yamaha T-85, Sony XDR-F1HD tuners, Triax FM5 horizontal beaming east.

It might be something like Radio Monte Carlo Doualiya. Maybe somebody with a trained ear might hear something suggestive in my two audio clips? Algeria mixes French and Arabic and plays music, but that would be DX from here! :)

Regards

Peter

FMDX Es 87 9 unids further clips received in Biratnagar, Nepal
The two audio clips posted to box.com* fit between the first (mainly music) and second (low bit rate) audio clips on this video.
The second audio clip in the video starts at about 1:00 min. At 1:03 OM says "Jerusalem"?
Kyrgyzstan was identified from a video clip recorded soon after the end of this video compilation.

FMDX Es 87 9 unids further clips received in Biratnagar, Nepal
The two audio clips uploaded before to box.com* fit between the first (mainly music) and second (low bit rate) audio clips on this video.
The second audio clip in the video starts at about 1:00 min. At 1:03 OM says "Jerusalem"? (Kyrgyzstan was identified from a video clip recorded soon after the end of this video compilation.)

From: pe1etr@...
Topic: 32373 Message: 32375

Audio only version of youtube upload-four clips from 87.9 maybe some double hop from middle east?
https://app.box.com/s/ae4d9juanc7yg92pnoa8
I've tried to get all four audio clips to the same volume level.
Please download it and send it to your MW and SW friends.

Thanks!

Peter

32382. FW: [UKQRM] Petition Against PLT: Reloaded

Yahoo group: SkywavesDX (2014)
Date: 2014-06-10 18:47:56 UTC
From: Jim Smith G0OFE
Topic: 32382 Message: 32382

Hi all,

I have forwarded this to the group as this will concern us all. Self explanatory.

Here is a link in English: http://t.co/PX6j0BJ8sB

If you have not already seen this and done so, please sign this petition.

Cheers

Jim.

Bournemouth, Dorset IO90BR.

8 element OP-DES yagi at 22-32ft, wideband vertical, Perseus SDR receiver with FM+, Elad FDM-S2 SDR Reciever, Funcube Dongle Pro+.

To: UKQRM@yahoogroups.com
Subject: [UKQRM] Petition Against PLT: Reloaded

Friends.

As you know, I was instrumental in leaking EN50561:2014 some weeks ago. There can be no mistake, this is a pernicious "standard" which has the capacity to inflict untold harm to the electromagnetic environment and to innocent users of the radio spectrum. If you are in any doubt about this, take a look at my HF spectrum - this is from just one pair of Comtrend adapters in a neighbour's house. https://www.youtube.com/watch?v=_08HHjE2VNs and then add 40dB to the S-meter reading - that is how much interference the new adapters will have the capacity to generate.

There is now a petition, directed at the EU and we have a window of opportunity to act. EN50561 has not yet been presented to be published in the OJ. Radio users need to take an aggressive stance now or face the consequences later. Do you honestly believe that with an added 40dB of emissions, the notches will take care of the intermodulation from other electrical devices on the network? The amateur bands may be notched but IMD knows nothing of these since it is created by third-party hardware and outside the control of the PLT adapters. If I sold my house unwittingly to a SWL as it is right now - what hope would they have of pursuing their hobby? Add 40dB and I can bet you they will will lost the vast majority of broadcast stations, let alone other interesting transmissions. How will

dynamic notching know what part of the spectrum you are trying to listen to if you don't transmit? If you are lucky your preferred broadcast station 'might' be notched. May be, if its signal is strong enough on the mains wiring of the neighbour's house. . .

I know what you are thinking - "we tried a petition once before and it got few signatures." Would it help you to know that the current petition already is past six and a half thousand and picking up pace? That is considerably better than the UK petition to No.10. We have an opportunity to send a loud and clear message to the EU that radio users, world-wide, will not stand for this. Make no mistake, once these devices are in production - most likely in China, it will not take long for the adapters to spread throughout the world, ignoring borders, administrations and market surveillance authorities.

This time we must unite like never before and spread the message about the petition to every person that we can conceive might be affected by increased interference on HF. Remember EN50561 is specified from 1.6 MHz to 240 MHz so unlike previous adapters, top band is now also in the frame and so is VHF.

There is one fly in the ointment. The original petition was started in German and consequently if one tries to sign it directly, one needs translation tools; the petition text has been translated but the web-interface to complete the process will continue in German. DON'T PANIC!

Once you have read the petition, you can make a small change in the URL to switch languages to English and complete the process with an English interface (I don't know about you but I'm not too keen on signing something that I cannot understand!)

The original petition is at: https://secure.avaaz.org/de/petition/An_Viviane_Reding_Vizepraesidentin_der_Europaeischen_Kommission_Stopp_fuer_PLCTechnologie_Grenzwert_von_der_EU_um_das_20_1

or http://bit.ly/eu-plt in case the long URI is broken by Yahoo.

Once read, look at the URL and after "avaaz.org/" there are two letters "de" (for German language), switch these to "en" and you will be presented with the English interface (don't forget to hit enter). There is no description (we are trying to fix this) but you have already seen it - so it is simply a matter of signing.

The best way currently to promote this is to circulate my blog entry at: http://wp.g7cnf.me.uk/petition-against-plt-plc-to-the-eu/ which covers what I have written above; it would be easier to share an ideal with a URL than it is to circulate a wordy email and retain interest. If passing verbally I have shortened the blog URL to: http://bit.ly/plt-petition

This is too important for us to fail. Do not limit your distribution to UK/EU but tell everybody - sooner or later these devices will be everywhere and I believe that everyone has the right to object.

Best wishes and power to your elbow,

Nige.G7CNF

It started out as a scan for signals travelling by general
aircraft/troposcatter, but a short spell of weak tropo to Schleswig
Holstein and Denmark became apparent at 1144. This subsided very quickly
and then I realised that the North-east of England was slightly
enhanced. Signals from Flensburg and Naestved were stable for several
minutes.

As for the Es, I blinked at just the wrong moment and missed most of them.

Good DX!

** Personal Skegness 'First'

Poor! Puny! Paltry! Pathetic! Piddling! These words perfectly picture my personal painstaking pursuits in today's petty propagational DX performance. Portugal (which also begins with P) came in for a while too, but signals were sparse and well below RDS levels.

I think I can say without any shadow of a doubt that this year's season is not as good as last year's. In fact I don't personally recall one this bad EVER! You can't have it good all the time of course, but we knew it was going to be difficult to live up to last year's season.

Good DX!

89.1 MHz Perhaps the announcer says at 0.29 "...huna idha'atu Matruh...." (I'm not 100% sure)

91.5 may be " Radio al Quran al Kareem" Perhaps from Egypt.

Hello Group,

I got an interesting recording from my friend Ruud Vos in Nederland,
a log of his from yesterday at 14.00 UTC.

The frequency is "a" - but I would Guess +/- a few Hz .

Clear identification - but I can`t find any suitable station in FM list or on the web.
Somehow I think this one does not sound like East Slavic Language, but it might of course be dialect variations. My first Guess was ROU or MDA.

Opinions very welcome, recording enclosed.

73!

Thank you for help for all. There are many unlisted stations in
Middle-East area, that it's possible from Egypt, but a few days before I
received this on 87,6 MHz.
http://enjoe.ucoz.hu/_ld/2/262_876u.mp3 - ID: "Ida'at u Quran al Kareem
min al-Qahira" - it is from Egypt.

By the way, I received an other unlisted station on 90,2 MHz from Syria,
name is Rayan FM. RDS PI: 5000 Ps: Rayan FM (web: http://www.rayanfm.com/)
http://enjoe.ucoz.hu/_ld/2/237_902rayanfm.mp3
http://enjoe.ucoz.hu/load/es_2014/es_2014_majus_4/90_2_mhz_syr_rayan_fm/55-1-0-237

Good DX.

Jozsi from Hungary

32412. Sony ST-311 Instruction manual

Yahoo group: SkywavesDX (2014)
Date: 2014-06-11 19:31:31 UTC
From: davebunyan@...
Topic: 32412 Message: 32412

Can anyone who has a Sony ST-311 instruction manual have look and see if there is anything that tells you how to clear the station names out of the pre-sets.

I can clear the memory by holding down the memory button and then turning the power on - but that is a total clear out.

Reason for asking is that I'm finding the ability to set the ST-311 to auto scan through the presets is giving some excellent results especially during opening like today when stations pop up for a few minutes. When a strong enough signal is received the station name is captured to the preset - which is VERY useful as RDSpy captures the data and not the frequencies. A bit of detective work can show that an entry in the RDSSpy log can only relate to one particular frequency of the ones I'm scanning.

However I need to reset them fairly quickly and if I can do it without losing the preset frequencies that would be good. I've got the service manual but that doesn't have the operating instructions.

Thanks

David

Hi Andy,

On the login page of FMList - is you scroll down there is PI Code search field - enter E0FD into it and you will get a couple of suggestions to then check in the main FMList/myFM. Or as it tells me it is Spanish go straight to FMList and search on pi_id and if that doesn't work try the pi-reg box. Make sure the frequency box is blank.

Hi,

I posted without fully reading your comment. New ones keep turning up don't they?. I've just managed to track PI:5000 on 101.2 as I had the full RDS of R._LUNA - there is a Radio Luna on that freq - so looks like pi code had changed, but there's not enough of the station name in your case to even guess what it might be. Filling in the missing letters can be a bit like playing hangman.

32431. AW: [SkywavesDX] UK question

Yahoo group: SkywavesDX (2014)
Date: 2014-06-13 10:09:35 UTC
From: Günter Lorenz
Topic: 32429 Message: 32431

Thanks Andy,

FMLIST updated. OFCOM file still has Heart, although it says "last updated 09/06/14".

73,
Günter

32432. Online now for remote tuning

Yahoo group: SkywavesDX (2014)
Date: 2014-06-13 11:06:59 UTC
From: John Faulkner, Skegness
Topic: 32432 Message: 32432

I am trying a few experiments with TeamViewer.

If anybody would like to connect and remotely control the XDR software here, please download TeamViewer (free and no spam). Connect with User ID 284684388 and today's password is: 22zs8j.

Unless I have to dash out I will be online for another hour or two.

Please use the chat facility so I can adjust the antenna beam/polarisation to suit.

Only minor drawback to this is several people will be trying to control the cursor at once which may interfere with the chat. This is one of the things I want to test to see if I can iron that out.

Cheers

John

32433. This Es season so far - poor one or not?

Yahoo group: SkywavesDX (2014)
Date: 2014-06-14 07:54:53 UTC
From: Jim Smith G0OFE
Topic: 32433 Message: 32433

There has been a little debate about the quality of this Es season so far, with several saying that it has been a poor one in the UK at least. The MUF maps strongly suggests it has been a lot better further east, though even there recent days have been quieter, probably down to the high amount of solar flaring which from my experience usually has a detrimental effect on temperate zone Es.

I have come up with the following stats - these do relate to Es contacts recorded on the 2m band (data from MMMOVHF), nevertheless I think it is a reasonable indication of how often Es reaches the higher frequencies above 50Mhz.

The figures show the number of days in June, up to the 14th, on which Es has been recorded on the 2m band in recent years:

2008 - 5

2009 - 11

2010 - 10

2011 - 4

2012 - 7

2013 - 6

2014 - 3

To put it in graphic form, this link http://mmmonvhf.de/eseval.php?sum=1 is worth a look. Scroll down to the "Number of reported high Es MUF and Es between April and September) bar chart and you can see how little there has been in this June (barely 60 hours or so, so far (we are virtually half way through) compared with recent years.

I am not sure about the reliability of the earlier years on that bar chart as it relies on reports - I was not active in the early noughties, so cannot comment.

The figures and graphs seem to bear out my own personal gut feel that this has been a poor year so far, in terms of the amount of Es.

There is still plenty of time of course, but my own experience from my years of working DX on 6m and 2m is that seasons with poor starts do not improve very much.

32435. NRW Local Stations - Any local programming?

Yahoo group: SkywavesDX (2014)
Date: 2014-06-14 09:25:16 UTC
From: John Faulkner, Skegness
Topic: 32435 Message: 32435

Can somebody please advise if and when the German local radio networks in the NRW region broadcast local programming?

Occasionally I receive these stations very weakly at the top of the dial and it is impassible to know which station I am tuned to unless there are local drop-in IDs or commercials. Their websites are not much help, even after translation.

The usual frequencies are 103.9, 105.2, 105.7, 105.8, 106.9, 107.4, 107.6.

106.9 Radio Euskirchen and 107.4 Radio Wuppertal are the most regular. and local IDs are occasionally heard. 105.2 was coming in quite clearly earlier but fade-ins never coincided with an ID.

Thanks.

John

Interesting research, Jim, but I don't think these figures can be used to prove what you think they are proving. Es MUF reaching 2m is not a common event during any given Es opening - 2m is not renowned as an Es band. It's analogous to saying the summer has been poor as the temperature has only rarely reached 35C. Though it may have consistently reached 25 or 30. IMHO the figures show that exceptionally high Es MUF have been rare this season to date. Unless there is a correlation between the regularity of the Es MUF at 50, 100 and 145 MHz. However given the inherent stochastic nature of Es I would suppose that that would be very complex if it exists at all. In saying the above I am not denying that there is anecdotal evidence from band II dxers asserting a poor season.

To call the season I think you really have to look at the quintessential Es band - 6m. From my perspective 6m has been fair to ok-ish - I have increased my DXCC count by 17% and squares total by 10%, almost attaining my modest season's goals.

Cheers

Stuart

If 6m has been just "fair to OK-ish" then that would equate to a poor season on Band 2, which is certainly the perspective I'm viewing it from. This summary of the season to date backs this up:

http://mmmonvhf.de/eseval.php?y=2014

As you can see, a total blank for the last 3 days, not what you would expect for June. Last year was exceptionally good which has raised expectations of course but this so far has been the worst start to a season in the time I've been in Whitchurch, which is 9 years.

Good DX.

Fair points Stuart - however working stuff on 6m is all relative.

If you look at the "high MUF" graphs in the link I posted, you can see how low this June is if you compare with several previous ones allowing for the fact that we are half way through. Those are not just about 2m. (Though the numbers I posted in my original post are, of course.)

To get a truer picture, you'd need to compare what you were working this year on 6m with previous ones.

If you have 40 something countries and the high 100-and-something grids worked on 6m at the start of the season, then of course you're always going to be able to add to your totals. Even with 500+ grids worked on 6m I was still picking a few up on Es each year.

Just goes to show you can use whatever statistics you want to prove anything J

My 2p's worth, if you want it.

The season got off to a very early start on band 2. It gave us high expectations.

I have been comparing my own figures with previous year's. Until the first week of June, the number of openings on band 2 were only very slightly down on last year, but they were subdued openings and often too brief to be of any use. May was definitely better than June has been so far, very odd, showing how things are deteriorating. Summarising, the season started early, but it was below average at band 2 frequencies, then it went downhill. This is probably the worst Es season I can remember.

John

That graph is for 2m – see what I wrote below.

Looking at the 2m graph for June last year there is a 4 day period with no 2m Es and a couple of 6 day periods with very little 2m Es. OMs can look themselves at previous years. In summary, to have 3 days without 2m Es in June is perfectly normal.

Again I don’t doubt that this is below average for Band II dxers (though you have a fixed antenna which will miss swirling cloud from East to North/South/SouthWest to West which is a typical pattern) but we need to find real stats to back this up.

Regards

Stuart

Interesting research, Jim, but I don’t think these figures can be used to prove what you think they are proving. Es MUF reaching 2m is not a common event during any given Es opening – 2m is not renowned as an Es band. It’s analogous to saying the summer has been poor as the temperature has only rarely reached 35C. Though it may have consistently reached 25 or 30. IMHO the figures show that exceptionally high Es MUF have been rare this season to date. Unless there is a correlation between the regularity of the Es MUF at 50, 100 and 145 MHz. However given the inherent stochastic nature of Es I would suppose that that would be very complex if it exists at all. In saying the above I am not denying that there is anecdotal evidence from band II dxers asserting a poor season.

To call the season I think you really have to look at the quintessential Es band – 6m. From my perspective 6m has been fair to ok-ish – I have increased my DXCC count by 17% and squares total by 10%, almost attaining my modest season's goals.

Cheers

Stuart

Subject: [SkywavesDX] This Es season so far - poor one or not?

There has been a little debate about the quality of this Es season so far, with several saying that it has been a poor one in the UK at least. The MUF maps strongly suggests it has been a lot better further east, though even there recent days have been quieter, probably down to the high amount of solar flaring which from my experience usually has a detrimental effect on temperate zone Es.

I have come up with the following stats – these do relate to Es contacts recorded on the 2m band (data from MMMOVHF), nevertheless I think it is a reasonable indication of how often Es reaches the higher frequencies above 50Mhz.

The figures show the number of days in June, up to the 14th, on which Es has been recorded on the 2m band in recent years:

2008 – 5

2009 – 11

2010 – 10

2011 – 4

2012 – 7

2013 – 6

2014 – 3

To put it in graphic form, this link http://mmmonvhf.de/eseval.php?sum=1 is worth a look. Scroll down to the "Number of reported high Es MUF and Es between April and September) bar chart and you can see how little there has been in this June (barely 60 hours or so, so far (we are virtually half way through) compared with recent years.

I am not sure about the reliability of the earlier years on that bar chart as it relies on reports – I was not active in the early noughties, so cannot comment.

The figures and graphs seem to bear out my own personal gut feel that this has been a poor year so far, in terms of the amount of Es.

There is still plenty of time of course, but my own experience from my years of working DX on 6m and 2m is that seasons with poor starts do not improve very much.

Here in London on 6m it has been the opposite. May was quiet whilst the first week of June really opened up.

It’s a shame there are not more 6m dxers in North Africa as I’m pretty sure there are paths there that we don’t realise due to no ham being at the other end. One advantage that Band II dxers have is that there are a lot more broadcast stations in North Africa than amateurs. Blaggard has been getting some interesting 40+ MHz comms from Africa.

My 2p's worth, if you want it.

The season got off to a very early start on band 2. It gave us high expectations.

I have been comparing my own figures with previous year's. Until the first week of June, the number of openings on band 2 were only very slightly down on last year, but they were subdued openings and often too brief to be of any use. May was definitely better than June has been so far, very odd, showing how things are deteriorating. Summarising, the season started early, but it was below average at band 2 frequencies, then it went downhill. This is probably the worst Es season I can remember.

No the graphs are for general VHF (high MUF) and only the red parts reference 2m. Looking at June 2013 I can only see two days (the 1st and 28th) with blank days, and they were surrounded by generally higher activity than this season has seen so far.

Of course, it may pick up for the second half of June and July could end up being the best month of all, but so far it has definitely been poor, fixed aerial or no fixed aerial.

Good DX.

Nick, Whitchurch, Hampshire.

You are absolutely right Ruud. At least, for our purposes, but the 6m and 2m stats are relevant from the point of view that they still show how high the MUF has been, etc.

I keep a check on my own totals each year and often make comparisons. The difficulty is that the speed of my loggings has greatly increased this season thanks to using two computers and the XDR-GTK software control. So I am not too far behind last year's totals, but that's putting quantity before quality. That said, I suspect there have been more openings to the far south-east of Europe than last season.

I sometimes sort through large qualities of loggings on FM List to make comparisons but there are limits to doing this. Maybe there are sets of data or graphs available where we can compare the seasons. Databases give you the ability to calculate such data easily, so it would be nice to be able to see something along these lines soon.

It's true though, figures can be manipulated to tell you anything you want to know.

It’s a fair point. You could argue that 6m/2m (and 4m) amateur contacts are more rigorous from an authentication viewpoint as they generally involve 2-way communication. However that is counter-balanced by the lack of amateurs in large swaths of the globe.

why comparing 2 and 6 metre while you can compare every day all fm openings at website fmlist which goes back many year's.

If 6m has been just "fair to OK-ish" then that would equate to a poor season on Band 2, which is certainly the perspective I'm viewing it from. This summary of the season to date backs this up:

http://mmmonvhf.de/eseval.php?y=2014

As you can see, a total blank for the last 3 days, not what you would expect for June. Last year was exceptionally good which has raised expectations of course but this so far has been the worst start to a season in the time I've been in Whitchurch, which is 9 years.

Good DX.

Nick, Whitchurch, Hampshire.

Interesting research, Jim, but I don’t think these figures can be used to prove what you think they are proving. Es MUF reaching 2m is not a common event during any given Es opening – 2m is not renowned as an Es band. It’s analogous to saying the summer has been poor as the temperature has only rarely reached 35C. Though it may have consistently

reached 25 or 30. IMHO the figures show that exceptionally high Es MUF have been rare this season to date. Unless there is a correlation between the regularity of the Es MUF at 50, 100 and 145 MHz. However given the inherent stochastic nature of Es I would suppose that that would be very complex if it exists at all. In saying the above I am not denying that there is anecdotal evidence from band II dxers asserting a poor season.

To call the season I think you really have to look at the quintessential Es band – 6m. From my perspective 6m has been fair to ok-ish – I have increased my DXCC count by 17% and squares total by 10%, almost attaining my modest season's goals.

Cheers

Stuart

There has been a little debate about the quality of this Es season so far, with several saying that it has been a poor one in the UK at least. The MUF maps strongly suggests it has been a lot better further east, though even there recent days have been quieter, probably down to the high amount of solar flaring which from my experience usually has a detrimental effect on temperate zone Es.

I have come up with the following stats – these do relate to Es contacts recorded on the 2m band (data from MMMOVHF), nevertheless I think it is a reasonable indication of how often Es reaches the higher frequencies above 50Mhz.

The figures show the number of days in June, up to the 14th, on which Es has been recorded on the 2m band in recent years:

2008 – 5

2009 – 11

2010 – 10

2011 – 4

2012 – 7

2013 – 6

2014 – 3

To put it in graphic form, this link http://mmmonvhf.de/eseval.php?sum=1 is worth a look. Scroll down to the "Number of reported high Es MUF and Es between April and September) bar chart and you can see how little there has been in this June (barely 60 hours or so, so far (we are virtually half way through) compared with recent years.

I am not sure about the reliability of the earlier years on that bar chart as it relies on reports – I was not active in the early noughties, so cannot comment.

The figures and graphs seem to bear out my own personal gut feel that this has been a poor year so far, in terms of the amount of Es.

There is still plenty of time of course, but my own experience from my years of working DX on 6m and 2m is that seasons with poor starts do not improve very much.

A very god post Jim I think this is a poor E's season so far and I am basing this on the lack of band 2 DX on my tuners.
There have been a few good openings but it's well down on previous years also tropo has also been poor as well.

We were spoiled last year with excellent DX anyway lets hope it does pick up at some point.

Andy

It’s a fair point. You could argue that 6m/2m (and 4m) amateur contacts are more rigorous from an authentication viewpoint as they generally involve 2-way communication. However that is counter-balanced by the lack of amateurs in large swaths of the globe.

Could the occurrence of three very strong solar flares in two days knock out the E-layer and hence we haven't had any Es? Or is that the Es clouds are further east - as on a number of days earlier in the month I've been looking at the visual logs on FMList and been muttering - 'just move this way a bit more!'

As I am 'retired' I can't compare to my previous season - but these are the days I've had Es in 2014:

12 May - a small opening on the OIRT Band to BLR
14 May - a couple of very short openings - ROU, MRC
16 May - bigger opening OIRT/Band 2 - UKR, BLR, RUS, a number of Balkan states, BUL
Holiday - 17-24th May
24 May - small evening opening I, TUN, ALG
25 May - morning opening, ROU, BUL, I
27 May - late afternoon - E, MRC
28 May - extended morning opening - OIRT/Band 2 - UKR, BLR, BUL, HNG, ROU, SRB, ALB, HRV
29 May - three Italian stations over a two minute period 1645-1647UTC
02 Jun - a very extensive opening from 0800-1200 - over a hundred stations logged in 17 countries
03 Jun - another extensive opening from around 0700-1000 - sixty four stations logged in 13 countries
04 Jun - a twenty minute opening to POR
05 Jun - 0830 to 1000UTC - TUN, ALG, E - afternoon gave a short opening to UKR in OIRT Band
06 Jun - activity from 0930-1130. OIRT Band to BLR, UKR and in the same period Band 2 to TUN, ALG
07 Jun - late afternoon opening to southern Italy and Greece - lots of stations
11 Jun - a small number of stations from BIH, I, TUN, POR, E throughout the day - unattended. Every time I was tuning nothing was there - so short lived reception.

So from 08 Jun to 14 Jun inclusive - only one day with a scattering of Es reception.

Rgds

David
Sittingboune

Stack of Sony tuners fed from multiple aerials including fixed direction FM5 yagis, rotatable 5ele K6STI and feeding multiple copies of RDSSpy. RTL-SDR dongle with SDR# used mainly for OIRT band - fed from E-W dipole for the band. (And yes folks the wiring resemples a rats-nest!)

Bit of both – on many occasions this year it's all been bit too far East.

The solar flaring is very likely at least partly responsible to the quieter few days generally.
